# 可执行文件格式：Mach-O

- 最新版本: v1.0.1
- 更新时间: 20240325

## 简介

介绍Mac和iOS等Apple苹果系统的常见可执行文件格式：Mach-O；先是Mach-O概览；包括背景知识的XNU、PIC等；然后介绍Mach-O格式，包括结构概述和结构图，以及结构详情，包括Header、Load Commands和Segment的数据；其中Header包括magic、cputype和cpusubtype、filetype、flags；Load Commands包括LC\_UUID、LC\_SEGMENT、LC\_SEGMENT\_64、LC\_SYMTAB、LC\_DYLD\_CHAINED\_FIXUPS、LC\_DYLD\_EXPORTS\_TRIE等；Segment包括TEXT、DATA、IMPORT、LINKEDIT、\_\_OBJC；以及各个Segment的section，比如symbol、strings等；然后是Mach-O格式的子项，包括FAT、codesign、虚拟地址、大小限制等；然后整理Mach-O的各种工具，包括MachOView、rabin2、jtool2、otool、pagestuff，以及每个工具的用法、举例、help语法等；

## 源码+浏览+下载

本书的各种源码、在线浏览地址、多种格式文件下载如下：

### HonKit源码

- [crifan/exec\\_file\\_format\\_macho](#): 可执行文件格式：Mach-O

### 如何使用此HonKit源码去生成发布为电子书

详见：[crifan/honkit\\_template: demo how to use crifan honkit template and demo](#)

### 在线浏览

- 可执行文件格式：[Mach-O book.crifan.org](#)
- 可执行文件格式：[Mach-O crifan.github.io](#)

### 离线下载阅读

- 可执行文件格式：[Mach-O PDF](#)
- 可执行文件格式：[Mach-O ePUB](#)
- 可执行文件格式：[Mach-O Mobi](#)

### 版权和用途说明

此电子书教程的全部内容，如无特别说明，均为本人原创。其中部分内容参考自网络，均已备注了出处。如发现有侵权，请通过邮箱联系我 [admin 艾特 crifan.com](mailto:admin@crifan.com)，我会尽快删除。谢谢合作。

各种技术类教程，仅作为学习和研究使用。请勿用于任何非法用途。如有非法用途，均与本人无关。

## 鸣谢

感谢我的老婆陈雪的包容理解和悉心照料，才使得我 crifan 有更多精力去专注技术专研和整理归纳出这些电子书和技术教程，特此鸣谢。

## 其他

### 作者的其他电子书

本人 crifan 还写了其他 150+ 本电子书教程，感兴趣可移步至：

# Mach-O概览

- Mach-O
  - Mach-O = Mach Object = Mach Object file format
  - 是什么： Mac 和 iOS 等 Apple 平台中的可执行文件格式

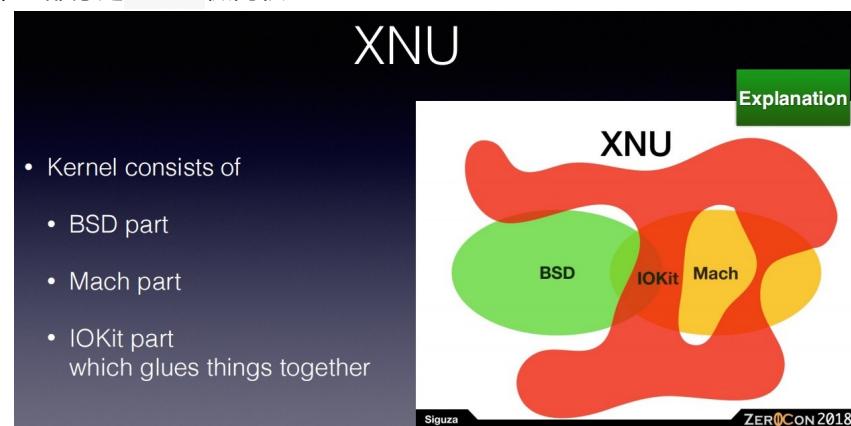

WHERE IS IT FOUND?

- /Applications/
- /Library/
- /usr/bin/
- /Cores/
- /System/

- 名词解释
  - Mach-O = Mach + O
  - Mach
    - iOS的内核是 XNU
    - XNU 由多个部分组成
    - 其中一部分是 Mach 微内核microkernel

- O = Object = 对象

- 用到 Mach-O 的系统

- Mach kernel
- NeXTSTEP
- macOS
- iOS

# Mach-O背景知识

2023-10-04 17:52:09

# XNU

- XUN
  - 名称
    - XNU = **X** is **N**ot **U**nix
  - 概述
    - 英文
      - XNU kernel is part of the Darwin operating system for use in macOS and iOS operating systems.
      - 中文
        - XNU是：iOS（和tvOS、watchOS）的（操作系统）内核
        - XNU也是Darwin的一部分
          - Darwin是MacOS的操作系统内核
  - 特点
    - XNU is a hybrid kernel combining the Mach kernel developed at Carnegie Mellon University with components from FreeBSD and a C++ API for writing drivers called IOKit. XNU runs on x86\_64 for both single processor and multi-processor configurations.
  - (开源代码) 源码
    - [opensource.apple.com](https://opensource.apple.com)
      - [Source Browser \(apple.com\)](https://sourceBrowser.apple.com)
    - Github
      - <https://github.com/apple/darwin-xnu>
        - apple/darwin-xnu: The Darwin Kernel (mirror)
  - XNU组成
    - 2个主要部分
      - Mach: 微内核=microkernel
        - 实现了操作系统的核心部分
      - BSD: 内核=kernel
        - BSD在Mach的基础上，实现了更高层的各种功能
  - 代码组成=代码树
    - config - configurations for exported apis for supported architecture and platform
    - SETUP - Basic set of tools used for configuring the kernel, versioning and kextsymbol management.
    - EXTERNAL\_HEADERS - Headers sourced from other projects to avoid dependency cycles when building. These headers should be regularly synced when source is updated.
    - libkern - C++ IOKit library code for handling of drivers and kexts.
    - libsa - kernel bootstrap code for startup
    - libsyscall - syscall library interface for userspace programs
    - libkdd - source for user library for parsing kernel data like kernel chunked data.
    - makedefs - top level rules and defines for kernel build.
    - osfmk - Mach kernel based subsystems
    - pexpert - Platform specific code like interrupt handling, atomics etc.
    - security - Mandatory Access Check policy interfaces and related implementation.
    - bsd - BSD subsystems code

- tools - A set of utilities for testing, debugging and profiling kernel.

## 查看系统信息中会有XNU的版本等信息

- iOS 15.1, iPhone8的信息

```
iPhone8-150:~ root# uname -a
Darwin iPhone8-150 21.0.0 Darwin Kernel Version 21.0.0: Sun Aug 15 20:55:55 PDT 2021
; root:xnu-8019.12.5~1/RELEASE_ARM64_T8015 iPhone10,1 arm Darwin
```

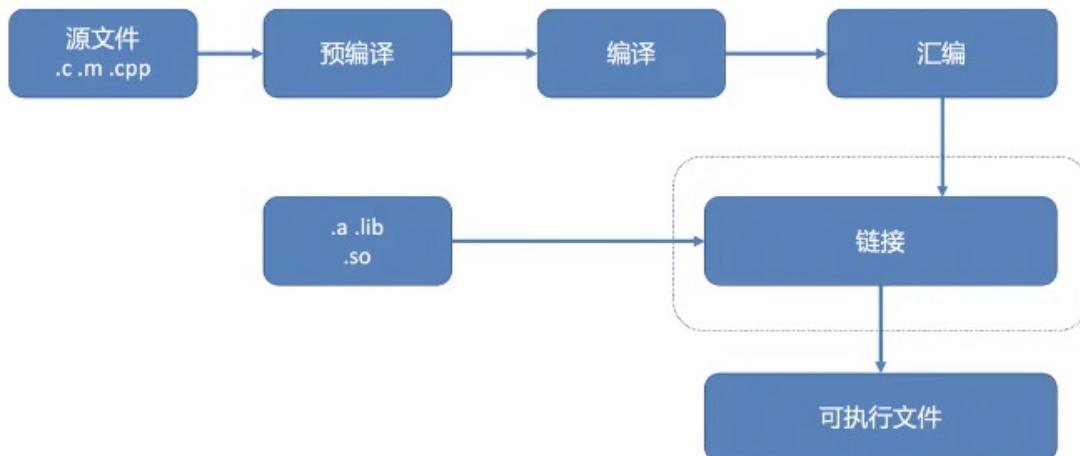

- xnu-8019.12.5~1/RELEASE\_ARM64\_T8015

- xnu是：iOS的内核
- 版本是：8019.12.5

# 编译链接加载过程

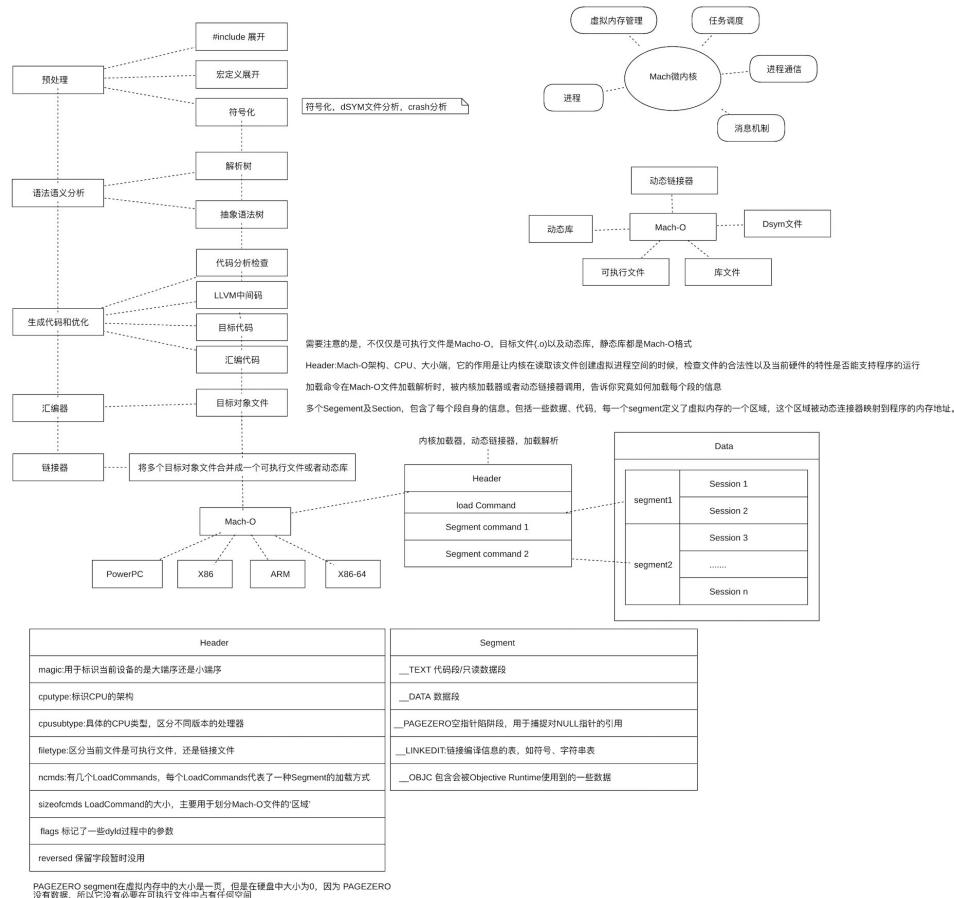

- 编译链接加载过程

  - 概述

  - 详解

## PIC

- PIC = Position-Independent Code = 位置无关代码
  - 详解
    - 位置无关代码（PIC）是 PowerPC 环境中使用的代码生成技术的名称，该技术允许动态链接器在非固定虚拟内存地址加载代码区域。如果没有某种形式的与位置无关的代码生成，操作系统将需要将您想要共享的所有代码放置在虚拟内存中的固定地址，这将使操作系统的维护变得非常困难。例如，支持共享库和框架几乎是不可能的，因为每个库和框架都需要预先分配一个永远不会改变的地址。
    - Mach-O 与位置无关的代码设计基于这样的观察：`__DATA` 段始终位于距 `__TEXT` 段恒定的偏移处。也就是说，动态加载器在加载任何 Mach-O 文件时，绝不会相对于其 `__DATA` 段移动文件的 `__TEXT` 段。因此，函数可以使用自己的当前地址加上固定偏移量来确定它希望访问的数据的位置。Mach-O 文件的所有段（不仅是 `__TEXT` 和 `__DATA` 段）相对于其他段的偏移量是固定的。
  - 官网文档
    - [Position-Independent Code](#)
  - 对比
    - Mach-O 的 PIC  $\approx$  ELF 的 GOT
      - 区别：Mach-O 代码使用直接偏移引用数据，而 ELF 通过全局偏移表间接访问所有数据。
    - PIC
      - $\approx$  PIE = Position-Independent Executable
        - 对应的 Mach-O 中有个 flag 是：MH\_PIE
      - $\approx$  ASLR

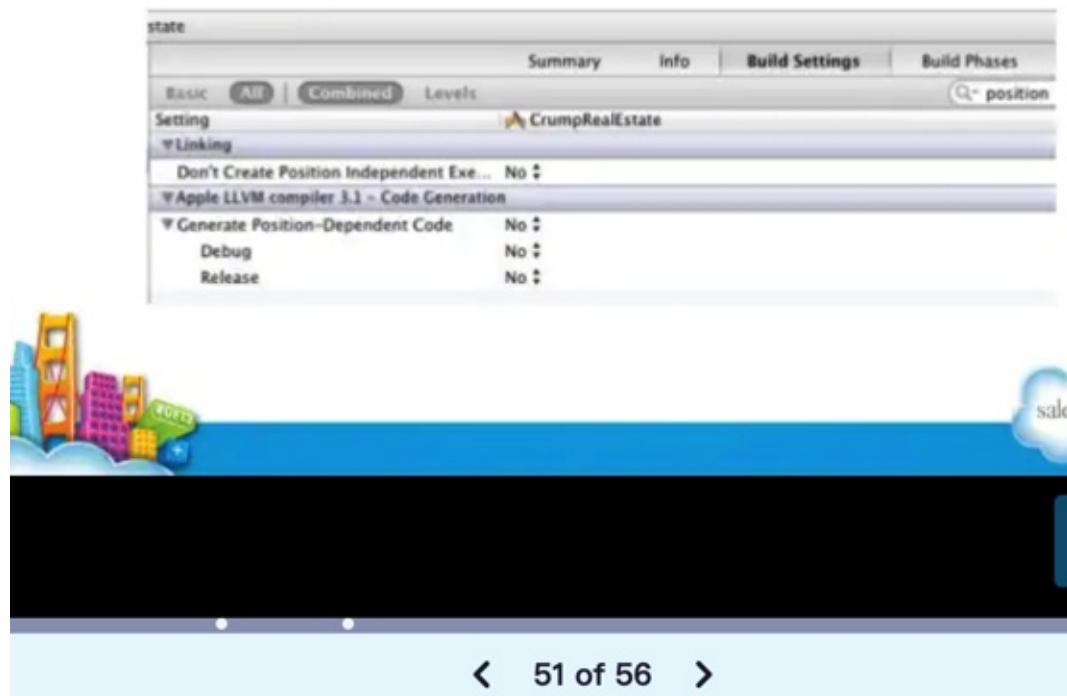

## ASLR

- ASLR = Address Space Layout Randomization = 地址空间布局随机化

参考：

## Enable ASLR in your app

- ASLR: Address Space Layout Randomization

去尝试给iOS的app去开启ASLR:

- Linking->Generate Position-Dependent Executable
  -
- Apple Clang - Code Generation->Generate Position-Dependent Code

◦

结果：

编译都会报错：

```
ld: -no_pie and -bitcode_bundle (Xcode setting ENABLE_BITCODE=YES) cannot be used together
Showing All Messages
-no_pie and -bitcode_bundle (Xcode setting ENABLE_BITCODE=YES) cannot be used together
```

看起来是和BITCODE的 ENABLE\_BITCODE=YES 相冲突了。

所以暂时放弃深究。

后记：

上述的：

Position-Dependent Executable 和 Generate Position-Dependent Code

很明显是：要关闭 ASLR = PIC = PIE 的意思啊

所以感觉是：

- ASLR = PIC = PIE : 默认已开启
  - 如果想要去关闭ASLR，才需要去更改设置，改为
    - Linking->Generate Position-Dependent Executable = YES
    - Apple Clang - Code Generation->Generate Position-Dependent Code = YES

# Mach-O结构概述

- Mach-O基本结构
  - Header : 文件类型、目标架构类型等
  - Load Commands : 描述文件在虚拟内存中的逻辑结构、布局
  - (Raw segment) data : 在Load commands中定义的Segment的原始数据
    - 一个或多个segment=段
      - 每个segment包含 一个或多个 section=节
      - 每个section包含 (某种类型的) 代码 或 数据

## Mach-O的Header

### Mach-O的Header结构图

- Header的详细定义
  - 
  - MachOView显示Mach-O的Header举例
    - 
    - 说明
      - 该文件是可执行文件
      - 文件的构架是x86\_64
      - number of Load commands表示有74个load command
      - MH\_TWOLEVEL二级名字空间
      - MH\_PIE 随机地址空间
  - Mach-O Core Dump File Structure

- - 内存映射 = 结构体偏移 = 结构体字段

◦

## **mach\_header**定义

- 精简定义

```

struct mach_header {
    uint32_t      magic;
    cpu_type_t   cpusubtype;
    cpu_subtype_t cpusubtype;
    uint32_t      filetype;
    uint32_t      ncmds;
    uint32_t      sizeofcmds;
    uint32_t      flags;
};

```

- 详细定义

源码定义：

```

struct mach_header {
    uint32_t      magic;          /* mach magic number identifier */
    cpu_type_t   cpusubtype;    /* machine specifier */
    cpu_subtype_t cpusubtype;   /* machine specifier */
    uint32_t      filetype;       /* type of file */
    uint32_t      ncmds;         /* number of load commands */
    uint32_t      sizeofcmds;     /* the size of all the load commands */
    uint32_t      flags;         /* flags */
};

/* Constant for the magic field of the mach_header (32-bit architectures) */
#define MH_MAGIC    0xfeedface /* the mach magic number */
#define MH_CIGAM    0xcefaedfe /* NXSwapInt(MH_MAGIC) */

struct mach_header_64 {
    uint32_t      magic;          /* mach magic number identifier */
    cpu_type_t   cpusubtype;    /* machine specifier */
    cpu_subtype_t cpusubtype;   /* machine specifier */
    uint32_t      filetype;       /* type of file */
    uint32_t      ncmds;         /* number of load commands */
    uint32_t      sizeofcmds;     /* the size of all the load commands */
    uint32_t      flags;         /* flags */
    uint32_t      reserved;      /* reserved */
};

/* Constant for the magic field of the mach_header_64 (64-bit architectures) */
#define MH_MAGIC_64 0xfeedfacf /* the 64-bit mach magic number */
#define MH_CIGAM_64 0xcfffaedfe /* NXSwapInt(MH_MAGIC_64) */

```

## Mach-O的Header的magic

- magic = 魔数

源码定义：

```
/* Constant for the magic field of the mach_header (32-bit architectures) */
#define MH_MAGIC      0xfeedface      /* the mach magic number */
#define MH_CIGAM      0xcefaedfe     /* NXSwapInt(MH_MAGIC) */

/* Constant for the magic field of the mach_header_64 (64-bit architectures) */
#define MH_MAGIC_64   0xfeedfacf /* the 64-bit mach magic number */
#define MH_CIGAM_64   0xcfffaedfe /* NXSwapInt(MH_MAGIC_64) */
```

->

- magic
  - 通用格式： 0xcafebabe
  - ( armv7 等) 32bit: 0xfeedface
  - ( arm64 等) 64bit: 0xfeedfacf

# Mach-O的Header的filetype

## 常见文件类型filetype

- Mach-O的filetype
  - 文件类型概述: Executables, bundles, dylibs, kexts, cores等等
  - 常见文件类型
    - MH\_EXECUTE =可执行文件= executable =应用
    - 文件: .app/xxx

HEADER: FILE TYPES & FLAGS

```

/* Constants for the filetype field of the mach_header */
#define MH_OBJECT    0x1 /* relocatable object file */
#define MH_EXECUTE   0x2 /* demand paged executable file */
#define MH_FVMLIB    0x3 /* fixed VM shared library file */
#define MH_CORE      0x4 /* core file */
#define MH_PRELOAD   0x5 /* preloaded executable file */
#define MH_DYLIB     0x6 /* dynamically bound shared library */
#define MH_DYLINKER  0x7 /* dynamic link editor */
#define MH_BUNDLE    0x8 /* dynamically bound bundle file */
#define MH_DYLIB_STUB 0x9 /* shared library stub for static linking only, no section contents */
#define MH_DSYM      0xa /* companion file with only debug sections */
#define MH_KEXT_BUNDLE 0xb /* x86_64 kexts */

/* Constants for the flags field of the mach_header */
#define MH_NOUNDEFS 0x1 /* the object file has no undefined references */
#define MH_INCRLINK 0x2 /* the object file is the output of an incremental link against a base
                      file and can't be link edited again */
#define MH_DYLDLINK 0x4 /* the object file is input for the dynamic linker and can't be
                      statically link edited again */
#define MH_BINDATLOAD 0x8 /* the object file's undefined references are bound by the dynamic
                        linker when loaded. */
#define MH_PREBOUND 0x10 /* the file has its dynamic undefined references prebound. */
...

```

- MH\_OBJECT
  - 目标文件
    - 文件: .o
  - 静态库文件=静态链接库= static library : N个 .o 合并在一起
    - 文件: .a
- MH\_DYLIB =动态链接库= dylib library : 类似于Win中的 DLL
  - 文件: .dylib 、 .framework/xxx
- MH\_DYLINKER : 动态链接编辑器
  - 文件: /usr/lib/dyld
- MH\_DSYM : 存储着二进制文件符号信息的文件
  - 文件: .dSYM/Contents/Resources/DWARF/xxx
    - 常用于分析APP的崩溃信息
    - 调试信息保存在: dSYM文件

## 全部文件类型解释

- 全部文件类型解释
  - MH\_OBJECT
    - The MH\_OBJECT file type is the format used for intermediate object files. It is a very compact format containing all its sections in one segment. The compiler and assembler usually create one MH\_OBJECT file for each source code file. By convention, the file name

extension for this format is .o.

- MH\_EXECUTE
  - The MH\_EXECUTE file type is the format used by standard executable programs.
- MH\_BUNDLE
  - The MH\_BUNDLE file type is the type typically used by code that you load at runtime (typically called bundles or plug-ins). By convention, the file name extension for this format is .bundle.
- MH\_DYLIB
  - The MH\_DYLIB file type is for dynamic shared libraries. It contains some additional tables to support multiple modules. By convention, the file name extension for this format is .dylib, except for the main shared library of a framework, which does not usually have a file name extension.
- MH\_PRELOAD
  - The MH\_PRELOAD file type is an executable format used for special-purpose programs that are not loaded by the OS X kernel, such as programs burned into programmable ROM chips. Do not confuse this file type with the MH\_PREBOUND flag, which is a flag that the static linker sets in the header structure to mark a prebound image.
- MH\_CORE
  - The MH\_CORE file type is used to store core files, which are traditionally created when a program crashes. Core files store the entire address space of a process at the time it crashed. You can later run gdb on the core file to figure out why the crash occurred.
- MH\_DYLINKER
  - The MH\_DYLINKER file type is the type of a dynamic linker shared library. This is the type of the dyld file.
- MH\_DSYM
  - The MH\_DSYM file type designates files that store symbol information for a corresponding binary file.

## filetype的定义

```
#define MH_OBJECT 0x1 /* relocatable object file */
#define MH_EXECUTE 0x2 /* demand paged executable file */
#define MH_FVMLIB 0x3 /* fixed VM shared library file */
#define MH_CORE 0x4 /* core file */
#define MH_PRELOAD 0x5 /* preloaded executable file */
#define MH_DYLIB 0x6 /* dynamically bound shared library */
#define MH_DYLINKER 0x7 /* dynamic link editor */
#define MH_BUNDLE 0x8 /* dynamically bound bundle file */
#define MH_DYLIB_STUB 0x9 /* shared library stub for static */
                      /* linking only, no section contents */
#define MH_DSYM 0xa /* companion file with only debug */
                  /* sections */
#define MH_KEXT_BUNDLE 0xb /* x86_64 kexts */
```

源码定义：

```
/*
 * The layout of the file depends on the filetype. For all but the MH_OBJECT
```

```

* file type the segments are padded out and aligned on a segment alignment
* boundary for efficient demand pageing. The MH_EXECUTE, MH_FVMLIB, MH_DYLIB,
* MH_DYLINKER and MH_BUNDLE file types also have the headers included as part
* of their first segment.
*
* The file type MH_OBJECT is a compact format intended as output of the
* assembler and input (and possibly output) of the link editor (the .o
* format). All sections are in one unnamed segment with no segment padding.
* This format is used as an executable format when the file is so small the
* segment padding greatly increases its size.
*
* The file type MH_PRELOAD is an executable format intended for things that
* are not executed under the kernel (proms, stand alones, kernels, etc). The
* format can be executed under the kernel but may demand paged it and not
* preload it before execution.
*
* A core file is in MH_CORE format and can be any in an arbitrary legal
* Mach-O file.
*
* Constants for the filetype field of the mach_header
*/
#define MH_OBJECT    0x1      /* relocatable object file */
#define MH_EXECUTE   0x2      /* demand paged executable file */
#define MH_FVMLIB    0x3      /* fixed VM shared library file */
#define MH_CORE      0x4      /* core file */
#define MH_PRELOAD   0x5      /* preloaded executable file */
#define MH_DYLIB     0x6      /* dynamically bound shared library */
#define MH_DYLINKER  0x7      /* dynamic link editor */
#define MH_BUNDLE    0x8      /* dynamically bound bundle file */
#define MH_DYLIB_STUB 0x9      /* shared library stub for static */
                           /* linking only, no section contents */
#define MH_DSYM      0xa      /* companion file with only debug */
                           /* sections */
#define MH_KEXT_BUNDLE 0xb      /* x86_64 kexts */

```

# Mach-O的Header的flags

## flags含义解释

- **MH\_NOUNDEFS**
  - The object file contained no undefined references when it was built.
- **MH\_INCRLINK**
  - The object file is the output of an incremental link against a base file and cannot be linked again.
- **MH\_DYLDLINK**
  - The file is input for the dynamic linker and cannot be statically linked again.
- **MH\_TWOLEVEL**
  - The image is using two-level namespace bindings.
- **MH\_BINDATLOAD**
  - The dynamic linker should bind the undefined references when the file is loaded.
- **MH\_PREBOUND**
  - The file's undefined references are prebound.
- **MH\_PREBINDABLE**
  - This file is not prebound but can have its prebinding redone. Used only when MH\_PREBOUND is not set.
- **MH\_NOFIXPREBINDING**
  - The dynamic linker doesn't notify the prebinding agent about this executable.
- **MH\_ALLMODSBOUND**
  - Indicates that this binary binds to all two-level namespace modules of its dependent libraries. Used only when MH\_PREBINDABLE and MH\_TWOLEVEL are set.
- **MH\_CANONICAL**
  - This file has been canonicalized by unprebinding—clearing prebinding information from the file. See the redo\_prebinding man page for details.
- **MH\_SPLIT\_SEGS**
  - The file has its read-only and read-write segments split.
- **MH\_FORCE\_FLAT**
  - The executable is forcing all images to use flat namespace bindings.
- **MH\_SUBSECTIONS\_VIA\_SYMBOLS**
  - The sections of the object file can be divided into individual blocks. These blocks are dead-stripped if they are not used by other code. See Linking for details.
- **MH\_NOMULTIDEFS**
  - This umbrella guarantees there are no multiple definitions of symbols in its subimages. As a result, the two-level namespace hints can always be used.

## flags定义

# HEADER: FILE TYPES & FLAGS

What we're focused on

```
/* Constants for the filetype field of the mach_header */
#define MH_OBJECT      0x1 /* relocatable object file */

                                         S_THREAD_LOCAL_VARIABLES */

#define MH_NO_HEAP_EXECUTION 0x1000000 /* When this bit is set, the OS will
                                         run the main executable with
                                         a non-executable heap even on
                                         platforms (e.g. i386) that don't
                                         require it. Only used in MH_EXECUTE
                                         filetypes. */

```

# Load Commands

- 概述
  - 位置: Load commands紧跟在Mach-O的Header之后
  - 作用: Load commands指定了文件的布局结构和链接特征
    - 有很多很多种Load commands
    - 这些加载指令清晰地告诉加载器如何处理二进制数据, 有些命令是由内核处理的, 有些是由动态链接器处理的

## Load Commands类型介绍

- 概述
  - LC\_SEGMENT : 被映射到内存的段
  - LC\_SYMTAB : 符号表
  - LC\_DYSYMTAB : 动态符号表
  - LC\_LOAD\_DYLIB : 动态链接库
- 详解
  - LC\_REQ\_DYLD = 0x8000\_0000
    - 含义: After MacOS X 10.1 when a new load command is added that is required to be understood by the dynamic linker for the image to execute properly the LC\_REQ\_DYLD bit will be or'ed into the load command constant. If the dynamic linker sees such a load command it it does not understand will issue a "unknown load command required for execution" error and refuse to use the image. Other load commands without this bit that are not understood will simply be ignored.
  - LC\_SEGMENT = 0x1
    - 数据结构定义: segment\_command
    - 含义: segment of this file to be mapped
      - Defines a segment of this file to be mapped into the address space of the process that loads this file. It also includes all the sections contained by the segment.
  - LC\_SYMTAB = 0x2
    - 数据结构定义: symtab\_command
    - 含义: link-edit stab symbol table info
      - Specifies the symbol table for this file. This information is used by both static and dynamic linkers when linking the file, and also by debuggers to map symbols to the original source code files from which the symbols were generated.
  - LC\_SYMSEG = 0x3
    - link-edit gdb symbol table info (obsolete)
  - LC\_THREAD = 0x4
    - 数据结构定义: thread\_command
    - 含义: thread
      - For an executable file, the LC\_UNIXTHREAD command defines the initial thread state of the main thread of the process. LC\_THREAD is similar to LC\_UNIXTHREAD but does not cause the kernel to allocate a stack.

- `LC_UNIXTHREAD = 0x5`
  - 含义: unix thread (includes a stack)
- `LC_LOADFVMLIB = 0x6`
  - load a specified fixed VM shared library
- `LC_IDFVMLIB = 0x7`
  - object identification info (obsolete)
- `LC_IDENT = 0x8`
  - object identification info (obsolete)
- `LC_FVMFILE = 0x9`
  - fixed VM file inclusion (internal use)
- `LC_PREPAGE = 0xa`
  - prepage command (internal use)
- `LC_DYSYMTAB = 0xb`
  - 数据结构定义: `dysymtab_command`
  - 含义: dynamic link-edit symbol table info
    - Specifies additional symbol table information used by the dynamic linker.
- `LC_LOAD_DYLIB = 0xc`
  - 数据结构定义: `dylib_command`
  - 含义: load a dynamically linked shared library
    - Defines the name of a dynamic shared library that this file links against.
- `LC_ID_DYLIB = 0xd`
  - 数据结构定义: `dylib_command`
  - 含义: dynamically linked shared lib ident
    - Specifies the install name of a dynamic shared library.
- `LC_LOAD_DYLINKER = 0xe`
  - 数据结构定义: `dylinker_command`
  - 含义: load a dynamic linker
    - Specifies the dynamic linker that the kernel executes to load this file.
- `LC_ID_DYLINKER = 0xf`
  - 数据结构定义: `dylinker_command`
  - 含义: dynamic linker identification
    - Identifies this file as a dynamic linker.
- `LC_PREBOUND_DYLIB = 0x10`
  - 数据结构定义: `prebound_dylib_command`
  - 含义: modules prebound for a dynamically linked shared library
    - For a shared library that this executable is linked prebound against, specifies the modules in the shared library that are used.
- `LC_ROUTINES = 0x11`
  - 数据结构定义: `routines_command`
  - 含义: image routines
    - Contains the address of the shared library initialization routine (specified by the linker's `-init option`).
- `LC_SUB_FRAMEWORK = 0x12`
  - 数据结构定义: `sub_framework_command`
  - 含义: sub framework

- Identifies this file as the implementation of a subframework of an umbrella framework.  
The name of the umbrella framework is stored in the string parameter.
- `LC_SUB_UMBRELLA = 0x13`
  - 数据结构定义: `sub_umbrella_command`
  - 含义: sub umbrella
    - Specifies a file that is a subumbrella of this umbrella framework.
- `LC_SUB_CLIENT = 0x14`
  - 数据结构定义: `sub_client_command`
  - 含义: sub client
    - A subframework can explicitly allow another framework or bundle to link against it by including an `LC_SUB_CLIENT` load command containing the name of the framework or a client name for a bundle.
- `LC_SUB_LIBRARY = 0x15`
  - 数据结构定义: `sub_library_command`
  - 含义: sub library
    - Defines the attributes of the `LC_SUB_LIBRARY` load command. Identifies a sublibrary of this framework and marks this framework as an umbrella framework.
- `LC_TWOLEVEL_HINTS = 0x16`
  - 数据结构定义: `twolevel_hints_command`
  - 含义: two-level namespace lookup hints
    - Contains the two-level namespace lookup hint table.
- `LC_PREBIND_CKSUM = 0x17`
  - prebind checksum
- `LC_LOAD_WEAK_DYLIB = 0x18 | LC_REQ_DYLD = 0x80000018`
  - load a dynamically linked shared library that is allowed to be missing (all symbols are weak imported)
- `LC_SEGMENT_64 = 0x19`
  - 数据结构定义: `segment_command_64`
  - 含义: 64-bit segment of this file to be mapped
    - Defines a 64-bit segment of this file to be mapped into the address space of the process that loads this file. It also includes all the sections contained by the segment.
- `LC_ROUTINES_64 = 0x1a`
  - 数据结构定义: `routines_command_64`
  - 含义: 64-bit image routines
    - Contains the address of the shared library 64-bit initialization routine (specified by the linker's `-init` option).
- `LC_UUID = 0x1b`
  - 数据结构定义: `uuid_command`
  - 含义: the uuid
    - Specifies the 128-bit UUID for an image or its corresponding dSYM file
- `LC_RPATH = 0x1c | LC_REQ_DYLD = 0x8000001c`
  - run path additions
- `LC_CODE_SIGNATURE = 0x1d`
  - local of code signature
- `LC_SEGMENT_SPLIT_INFO = 0x1e`

- local of info to split segments
- LC\_REEXPORT\_DYLIB = 0x1f | LC\_REQ\_DYLD = 0x8000001f
  - load and re-export dylib
- LC\_LAZY\_LOAD\_DYLIB = 0x20
  - delay load of dylib until first use
- LC\_ENCRYPTION\_INFO = 0x21
  - encrypted segment information
- LC\_DYLD\_INFO = 0x22
  - compressed dyld information
- LC\_DYLD\_INFO\_ONLY = 0x22 | LC\_REQ\_DYLD = 0x80000022
  - compressed dyld information only
- LC\_LOAD\_UPWARD\_DYLIB = 0x23 | LC\_REQ\_DYLD = 0x80000023
  - load upward dylib
- LC\_VERSION\_MIN\_MACOSX = 0x24
  - build for MacOSX min OS version
- LC\_VERSION\_MIN\_IPHONEOS = 0x25
  - build for iPhoneOS min OS version
- LC\_FUNCTION\_STARTS = 0x26
  - compressed table of function start addresses
- LC\_DYLD\_ENVIRONMENT = 0x27
  - string for dyld to treat like environment variable
- LC\_MAIN = 0x28 | LC\_REQ\_DYLD = 0x80000028
  - replacement for LC\_UNIXTHREAD
- LC\_DATA\_IN\_CODE = 0x29
  - table of non-instructions in \_\_text
- LC\_SOURCE\_VERSION = 0x2A
  - source version used to build binary
- LC\_DYLIB\_CODE\_SIGN\_DRS = 0x2B
  - Code signing DRs copied from linked dylibs
- LC\_ENCRYPTION\_INFO\_64 = 0x2C
  - 64-bit encrypted segment information
- LC\_LINKER\_OPTION = 0x2D
  - linker options in MH\_OBJECT files
- LC\_LINKER\_OPTIMIZATION\_HINT = 0x2E
  - optimization hints in MH\_OBJECT files
- LC\_VERSION\_MIN\_TVOS = 0x2F
  - build for AppleTV min OS version
- LC\_VERSION\_MIN\_WATCHOS = 0x30
  - build for Watch min OS version
- LC\_NOTE = 0x31
  - arbitrary data included within a Mach-O file
- LC\_BUILD\_VERSION = 0x32
  - build for platform min OS version
- LC\_DYLD\_EXPORTS\_TRIE = 0x33 | LC\_REQ\_DYLD = 0x80000033
  - used with `LinkeditDataCommand`, payload is trie
- LC\_DYLD\_CHAINED\_FIXUPS = 0x34 | LC\_REQ\_DYLD = 0x80000034

- used with `LinkeditDataCommand`
- `LC_FILESET_ENTRY` = `0x35` | `LC_REQ_DYLD` = `0x80000035`
  - used with `FilesetEntryCommand`

## Load Commands 定义

### LOAD COMMANDS

49 different load commands...

... eh, more like 30

`linkedit_data_command:`

- `LC_CODE_SIGNATURE`
- `LC_SEGMENT_SPLIT_INFO`
- `LC_FUNCTION_STARTS`
- `LC_DYLIB_CODE_SIGN_DRS`
- `LC_LINKER_OPTIMIZATION_HINT`

```
#define LC_SEGMENT 0x1 /* segment of this file to be mapped */
#define LC_SEGMENT_64 0x19 /* 64-bit segment of this file to be mapped */
#define LC_SYMTAB 0x2 /* link-edit stab symbol table info */
#define LC_DYSYMTAB 0xb /* dynamic link-edit symbol table info */
#define LC_LOAD_DYLIB 0xc /* load a dynamically linked shared library */
#define LC_CODE_SIGNATURE 0x1d /* local of code signature */
...
```

```
/*
 * The load commands directly follow the mach_header. The total size of all
 * of the commands is given by the sizeofcmds field in the mach_header. All
 * load commands must have as their first two fields cmd and cmdsize... Each
 * command type has a structure specifically for it. The cmdsize field is
 * the size in bytes of the particular load command structure plus anything
 * that follows it that is a part of the load command (i.e. section
 * structures, strings, etc.)... The cmdsize for 32-bit architectures MUST
 * be a multiple of 4 bytes and for 64-bit architectures MUST be a multiple
 * of 8 bytes (these are forever the maximum alignment of any load commands).
 * The padded bytes must be zero. All tables in the object file must also
 * follow these rules so the file can be memory mapped. Otherwise the
 * pointers to these tables will not work well or at all on some machines...
 */

struct load_command {
    uint32_t cmd; /* type of load command */
    uint32_t cmdsize; /* total size of command in bytes */
};
```

## LC\_UUID

- LC\_UUID
  - 是什么: Specifies the 128-bit UUID for an image or its corresponding dSYM file
  - 作用: 用来标识唯一APP
    - 每个可执行程序都有一个uuid, 这样根据不同的uuid能确定包。比如崩溃日志中就会包含uuid 字段。表示是哪个包崩溃了
  - 数据结构定义: `uuid_command`

## `uuid_command`定义

```
struct uuid_command {
    uint32_t     cmd;           /* LC_UUID */
    uint32_t     cmdsize;       /* sizeof(struct uuid_command) */
    uint8_t      uuid[16];      /* the 128-bit uuid */
};
```

## 举例

- MachOView查看到某 LC\_UUID
  -
- jtool2解析AwemeCore中 `jtool2 -l xxx/AwemeCore` 输出的
 

<code>LC 09: LC_UUID</code>	<code>UUID: F1FCF15A-6465-31F0-9300-5BA1B8F91017</code>
-----------------------------	---

## LC\_SEGMENT

- LC\_SEGMENT
  - 含义: Defines a segment of this file to be mapped into the address space of the process that loads this file. It also includes all the sections contained by the segment.
  - 数据结构定义: segment\_command

### segment\_command 定义

- 精简定义

```
struct segment_command {
    uint32_t cmd;
    uint32_t cmdsize;
    char segname[16];
    uint32_t vmaddr;
    uint32_t vmsize;
    uint32_t fileoff;
    uint32_t filesize;
    vm_prot_t maxprot;
    vm_prot_t initprot;
    uint32_t nsects;
    uint32_t flags;
};
```

- 完整定义

```
/*
 * The segment load command indicates that a part of this file is to be
 * mapped into the task's address space. The size of this segment in memory,
 * vmsize, maybe equal to or larger than the amount to map from this file,
 * filesize. The file is mapped starting at fileoff to the beginning of
 * the segment in memory, vmaddr. The rest of the memory of the segment,
 * if any, is allocated zero fill on demand. The segment's maximum virtual
 * memory protection and initial virtual memory protection are specified
 * by the maxprot and initprot fields. If the segment has sections then the
 * section structures directly follow the segment command and their size is
 * reflected in cmdsize.
 */
struct segment_command { /* for 32-bit architectures */
    uint32_t cmd;          /* LC_SEGMENT */
    uint32_t cmdsize;      /* includes sizeof section structs */
    char segname[16];      /* segment name */
    uint32_t vmaddr;       /* memory address of this segment */
    uint32_t vmsize;       /* memory size of this segment */
    uint32_t fileoff;      /* file offset of this segment */
    uint32_t filesize;     /* amount to map from the file */
    vm_prot_t maxprot;     /* maximum VM protection */
    vm_prot_t initprot;    /* initial VM protection */
    uint32_t nsects;       /* number of sections in segment */
```

```
    uint32_t      flags;      /* flags */  
};
```

## LC\_SEGMENT\_64

- LC\_SEGMENT\_64
  - 数据结构定义: segment\_command\_64
    - 含义: Defines a 64-bit segment of this file to be mapped into the address space of the process that loads this file. It also includes all the sections contained by the segment.

## segment\_command\_64定义

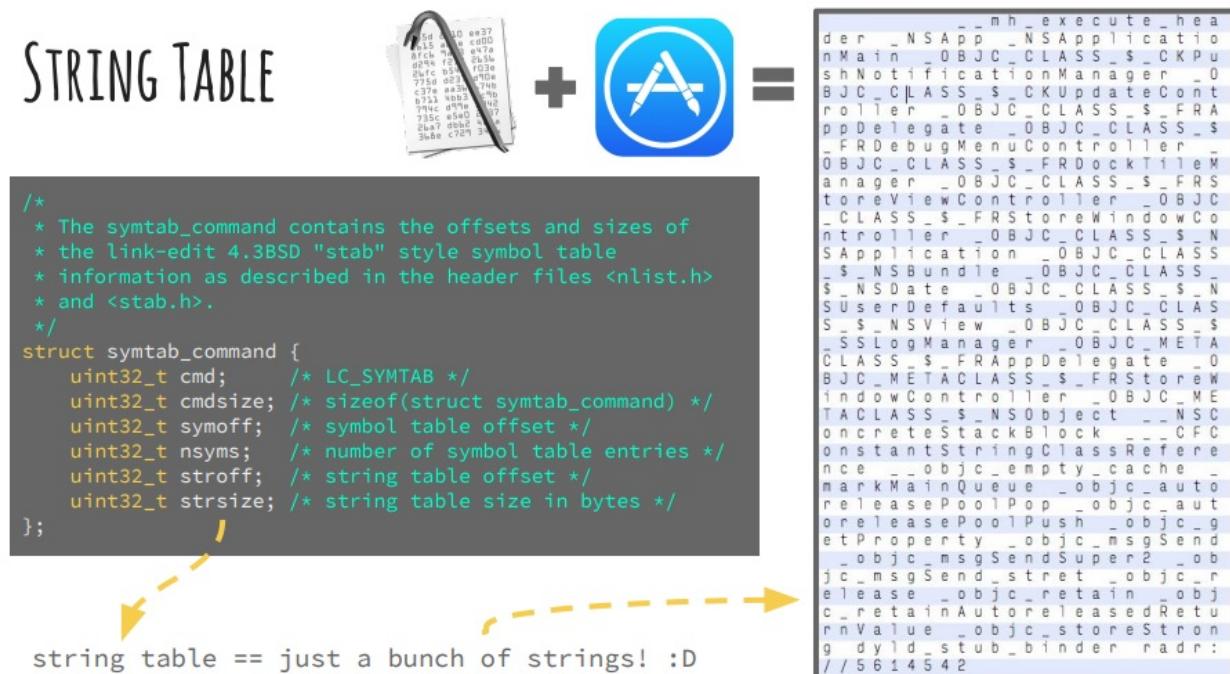

```
/*
 * The 64-bit segment load command indicates that a part of this file is to be
 * mapped into a 64-bit task's address space. If the 64-bit segment has
 * sections then section_64 structures directly follow the 64-bit segment
 * command and their size is reflected in cmdsize.
 */
struct segment_command_64 { /* for 64-bit architectures */
    uint32_t cmd;           /* LC_SEGMENT_64 */
    uint32_t cmdsize;       /* includes sizeof section_64 structs */
    char segname[16];       /* segment name */
    uint64_t vmaddr;        /* memory address of this segment */
    uint64_t vmsize;        /* memory size of this segment */
    uint64_t fileoff;       /* file offset of this segment */
    uint64_t filesize;      /* amount to map from the file */
    vm_prot_t maxprot;      /* maximum VM protection */
    vm_prot_t initprot;     /* initial VM protection */
    uint32_t nsects;        /* number of sections in segment */
    uint32_t flags;         /* flags */
};
```

## LC\_SYMTAB

- LC\_SYMTAB
  - 数据结构定义: symtab\_command
  - 含义: Specifies the symbol table for this file. This information is used by both static and dynamic linkers when linking the file, and also by debuggers to map symbols to the original source code files from which the symbols were generated.

### symtab\_command 定义

源码定义:

- 精简定义

```

struct symtab_command {
    uint32_t cmd;
    uint32_t cmdsize;
    uint32_t symoff;
    uint32_t nsyms;
    uint32_t stroff;
    uint32_t strsize;
};

```

- 详细定义

```

/*
 * The symtab_command contains the offsets and sizes of the link-edit 4.3BSD
 * "stab" style symbol table information as described in the header files
 * <nlist.h> and <stab.h>.

```

```
* symtab_command 包含了符号表、字符串索引表 的偏移量和大小 。  
*/  
struct symtab_command {  
    uint32_t cmd;          /* LC_SYMTAB */  
    uint32_t cmdsize;      /* sizeof(struct symtab_command) */  
    uint32_t symoff;        /* symbol table offset */  
    uint32_t nsyms;         /* number of symbol table entries */  
    uint32_t stroff;        /* string table offset */  
    uint32_t strsize;       /* string table size in bytes */  
};
```

## 举例

- MachOView查看到某 `LC_SYMTAB` 的效果
  - **说明**
    - 命令的大小是24 (十进制)
    - 符号表在物理文件的偏移量是 77360448
    - 符号表的大小 1069179
    - String表的物理文件偏移量是94479244
    - string表的大小是22093264

## LC\_DYLD\_CHAINED\_FIXUPS

- LC\_DYLD\_CHAINED\_FIXUPS
  - 说明: iOS 15.0+ 新出现的Load Command
  - 含义
    - Chained fixups is a new way to store information that will be used by dyld . Replacing LC\_DYLD\_INFO (\_ONLY), the chained fixups can save binary size and reduce launch time.
    - Traditionally, dyld , at launch time, needs to slide the fixed addresses with a random number, known as ASLR . This operation is called rebasing . Also, dyld needs to connect symbols from current binary with its linked dynamic libraries. This is called binding . Under the new format, both rebasing and binding have a new name, fixup , because they need to be "fixed up" before main function.
    - Chained fixups is enabled by default if the binary is built for device and targeted at iOS 14+. We can also manually enable it by passing -fixup\_chains to ld . To disable it, use -no\_fixup\_chains .

## LC\_DYLD\_EXPORTS\_TRIE

- LC\_DYLD\_EXPORTS\_TRIE
  - 说明: iOS 15.0+ 新出现的Load Command
  - 含义
    - If the binary is targeted at iOS 14+ or is linked with `-fixup_chains` linker flag, the same information is stored in `LC_DYLD_EXPORTS_TRIE` load command instead. The detail of this change is discussed at [Chained Fixups](#).

## segment

- Mach-O中包含1个或多个segment
  - 一个segment中包含0或多个section
- segment和sectoin的基本定义

◦

## 常见segment

- 概述
  - 最常用的segment: `__PAGEZERO`、`__TEXT`、`__DATA`、`__LINKEDIT`
- 举例
  - MachOView查看某Mach-O的效果

### ▼ Load Commands

**LC\_SEGMENT\_64 (\_PAGEZERO)**

► **LC\_SEGMENT\_64 (\_TEXT)**

► **LC\_SEGMENT\_64 (\_DATA)**

**LC\_SEGMENT\_64 (\_LINKEDIT)**

**LC\_DYLD\_INFO\_ONLY**

**LC\_SYMTAB**

**LC\_DYSYMTAB**

**LC\_LOAD\_DYLINKER**

**LC\_UUID**

**LC\_VERSION\_MIN\_IPHONEOS**

**LC\_SOURCE\_VERSION**

**LC\_MAIN**

**LC\_LOAD\_DYLIB (libc++.1.dylib)**

**LC\_LOAD\_DYLIB (libiconv.2.dylib)**

**LC\_LOAD\_DYLIB (libicucore.A.dylib)**

**LC\_LOAD\_DYLIB (libresolv.9.dylib)**

**LC\_LOAD\_DYLIB (libsqllite3.dylib)**

**LC\_LOAD\_DYLIB (libstdc++.6.dylib)**

**LC\_LOAD\_DYLIB (libxml2.2.dylib)**

**LC\_LOAD\_DYLIB (libz.1.dylib)**

**LC\_LOAD\_WEAK\_DYLIB (AVFoundation)**

**LC\_LOAD\_DYLIB (Accelerate)**

**LC\_LOAD\_DYLIB (AddressBook)**

**LC\_LOAD\_DYLIB (AssetsLibrary)**

**LC\_LOAD\_DYLIB (AudioToolbox)**

**LC\_LOAD\_DYLIB (CENetwork)**

- 详解

- **\_PAGEZERO**

- The static linker creates a **\_PAGEZERO** segment as the first segment of an executable file. This segment is located at virtual memory location 0 and has no protection rights assigned, the combination of which causes accesses to NULL, a common C programming error, to immediately crash. The **\_PAGEZERO** segment is the size of one full VM page for the current architecture (for Intel-based and PowerPC-based Macintosh computers, this is 4096 bytes or 0x1000 in hexadecimal). Because there is no data in the **\_PAGEZERO** segment, it occupies no space in the file (the file size in the segment command is 0).

- **\_TEXT**

- The **\_TEXT** segment contains executable code and other read-only data. To allow the kernel to map it directly from the executable into sharable memory, the static linker sets this segment's virtual memory permissions to disallow writing. When the segment is mapped into memory, it can be shared among all processes interested in its contents. (This is primarily used with frameworks, bundles, and shared libraries, but it is possible to run multiple copies of the same executable in OS X, and this applies in that case as well.) The read-only

attribute also means that the pages that make up the `__TEXT` segment never need to be written back to disk. When the kernel needs to free up physical memory, it can simply discard one or more `__TEXT` pages and re-read them from disk when they are next needed.

- `__DATA`
  - The `__DATA` segment contains writable data. The static linker sets the virtual memory permissions of this segment to allow both reading and writing. Because it is writable, the `__DATA` segment of a framework or other shared library is logically copied for each process linking with the library. When memory pages such as those making up the `__DATA` segment are readable and writable, the kernel marks them copy-on-write; therefore when a process writes to one of these pages, that process receives its own private copy of the page.
- `__OBJC`
  - The `__OBJC` segment contains data used by the Objective-C language runtime support library.
- `__IMPORT`
  - The `__IMPORT` segment contains symbol stubs and non-lazy pointers to symbols not defined in the executable. This segment is generated only for executables targeted for the IA-32 architecture.
- `__LINKEDIT`
  - The `__LINKEDIT` segment contains raw data used by the dynamic linker, such as symbol, string, and relocation table entries.

## 主要segment的section

- segment段
  - `__TEXT` 段
    - Section节
      - `__text` : The compiled machine code for the executable
      - `__const` : The general constant data for the executable
      - `__cstring` : Literal string constants (quoted strings in source code)
      - `__picsymbol_stub` : Position-independent code stub routines used by the dynamic linker (dyld)
  - `__DATA` 段
    - Section节
      - `__data` : Initialized global variables (for example `int a = 1;` or `static int a = 1;`)
      - `__const` : Constant data needing relocation (for example, `char * const p = "foo";`)
      - `__bss` : Uninitialized static variables (for example, `static int a;`)
      - `__common` : Uninitialized external globals (for example, `int a;` outside function blocks)
      - `__dyld` : A placeholder section, used by the dynamic linker
      - `__la_symbol_ptr` : **Lazy** symbol pointers. Symbol pointers for each undefined function called by the executable

- `__nl_symbol_ptr` : **Non lazy** symbol pointers. Symbol pointers for each undefined data symbol referenced by the executable

# \_\_TEXT

`__TEXT` segment的section：

- 概述

- 图

**Table 1** Major sections in the `__TEXT` segment

Section	Description
<code>__text</code>	The compiled machine code for the executable
<code>__const</code>	The general constant data for the executable
<code>__cstring</code>	Literal string constants (quoted strings in source code)
<code>__picsymbol_stub</code>	Position-independent code stub routines used by the dynamic linker (dyld).

- 文字

- `__TEXT, __text` : The compiled machine code for the executable
- `__TEXT, __const` : The general constant data for the executable
- `__TEXT, __cstring` : Literal string constants (quoted strings in source code)
- `__TEXT, __picsymbol_stub` : Position-independent code stub routines used by the dynamic linker (dyld).

- 详解

- `__TEXT, __text`

- Executable machine code
  - The compiler generally places only executable code in this section, no tables or data of any sort.

- 代码节，存放机器编译后的代码

- `__TEXT, __const`

- Initialized constant variables

- The compiler places all nonrelocatable data declared `const` in this section. (The compiler typically places uninitialized constant variables in a zero-filled section.)

- 存储`const`修饰的常量

- `__TEXT, __cstring`

- Constant C strings

- A C string is a sequence of non-null bytes that ends with a null byte ( `'\0'` ). The static linker coalesces constant C string values, removing duplicates, when building the final product.

- 代码运行中包含的字符串常量

- 比如

- 代码中定义 `#define kGeTuiPushAESKey @"DWE2#@e2!"` ,那 `DWE2#@e2!` 会存在这个区里

- `__TEXT, __objc_classname`

- `objc`类名

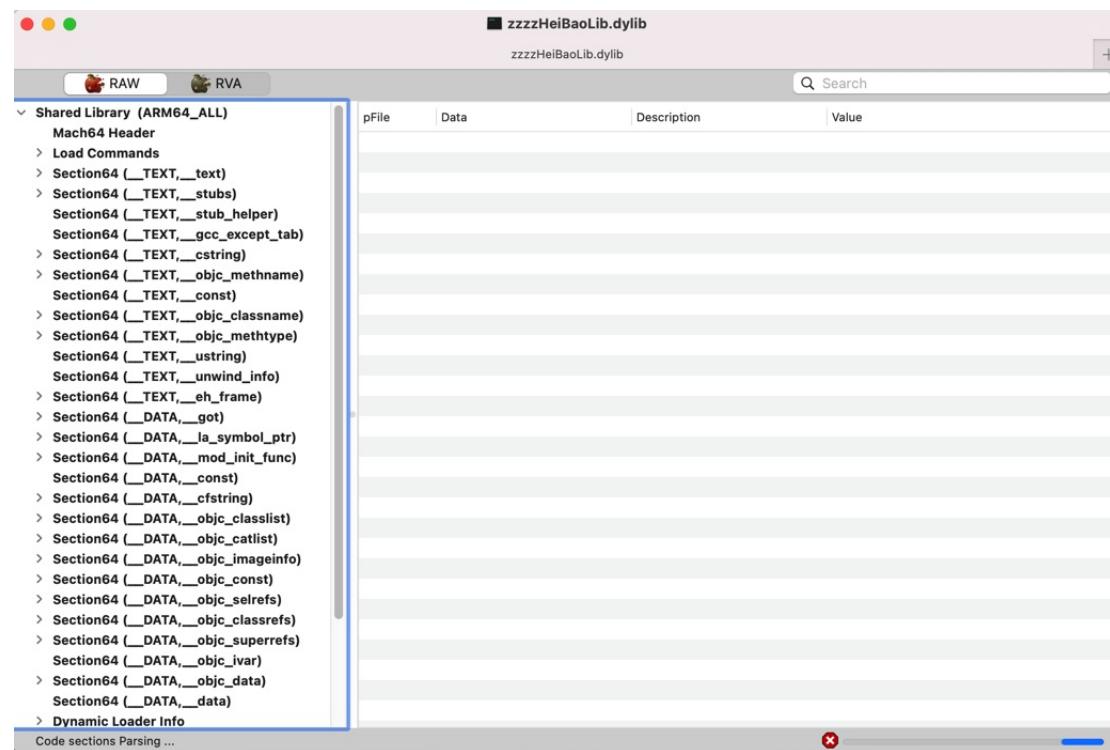

- `__TEXT, __objc_methname`

- `objc`的方法名称

- `__TEXT,__objc_methtype`
  - `objc`方法类型
- `__TEXT,__picsymbol_stub`
  - Position-independent indirect symbol stubs
    - See in Mach-O Programming Topics for more information.
- `__TEXT,__stubs`
  - 用于辅助做动态链接代码 (dyld)
- `__TEXT,__stub_helper`
  - 用于辅助做动态链接 (dyld)
- `__TEXT,__symbol_stub`
  - Indirect symbol stubs
    - 详见: [PIC](#)
- `__TEXT,__literal4`
  - 4-byte literal values
    - The compiler places single-precision floating point constants in this section. The static linker coalesces these values, removing duplicates, when building the final product. With some architectures, it's more efficient for the compiler to use immediate load instructions rather than adding to this section.
- `__TEXT,__literal8`
  - 8-byte literal values
    - The compiler places double-precision floating point constants in this section. The static linker coalesces these values, removing duplicates, when building the final product. With some architectures, it's more efficient for the compiler to use immediate load instructions rather than adding to this section.
- `__TEXT,__gcc_except_tab`
- `__TEXT,__dof_RACSignal`
- `__TEXT,__dof_RACCompon`
- `__TEXT,__unwind_info`
- `__TEXT,__ustring`

## TEXT, text

- section: \_\_TEXT, \_\_text
  - 含义
    - Executable machine code
    - The compiler generally places only executable code in this section, no tables or data of any sort.
    - 代码节，存放机器编译后的代码

## 举例

### arm64的akd中的 \_\_TEXT, \_\_text

#### jtool2

```
jtool2 --pages ./akd
0x0-0xf4000 __TEXT (999424 bytes)
  0x43d0-0xbbf24 __TEXT.__text (752468 bytes)
```

->

- 整个TEXT代码段范围: 0x0-0xf4000 \_\_TEXT (999424 bytes) = 976KB
  - 代码段内代码的二进制数据opcode的范围: 0x43d0-0xbbf24 \_\_TEXT.\_\_text (752468 bytes) = 0xB7B54 = 约734.8KB

#### rabin2

```
rabin2 -S ./akd
...
0 0x000043d0 0xb7b54 0x1000043d0 0xb7b54 -r-x 0.__TEXT.__text
```

->

- text代码段的
  - 起始地址: 0x000043d0
    - vaddr =虚拟地址: 0x1000043d0
  - 大小: 0xb7b54
    - = 0xB7B54 = 752468

#### MachOView

- 代码段的代码信息

# DATA

\_\_DATA segment的section：

- 概述

- 图

Table 2 Major sections of the \_\_DATA segment

Section	Description
__data	Initialized global variables (for example <code>int a = 1;</code> or <code>static int a = 1;</code> ).
__const	Constant data needing relocation (for example, <code>char * const p = "foo";</code> ).
__bss	Uninitialized static variables (for example, <code>static int a;</code> ).
__common	Uninitialized external globals (for example, <code>int a;</code> outside function blocks).
__dyld	A placeholder section, used by the dynamic linker.
__la_symbol_ptr	"Lazy" symbol pointers. Symbol pointers for each undefined function called by the executable.
__nl_symbol_ptr	"Non lazy" symbol pointers. Symbol pointers for each undefined data symbol referenced by the executable.

- 文字

- \_\_DATA, \_\_data : Initialized global variables (for example `int a = 1;` or `static int a = 1;` ).
    - \_\_DATA, \_\_const : Constant data needing relocation (for example, `char * const p = "foo";` ).
    - \_\_DATA, \_\_bss : Uninitialized static variables (for example, `static int a;` ).
    - \_\_DATA, \_\_common : Uninitialized external globals (for example, `int a;` outside function blocks).
    - \_\_DATA, \_\_dyld : A placeholder section, used by the dynamic linker.
    - \_\_DATA, \_\_la\_symbol\_ptr : **Lazy** symbol pointers. Symbol pointers for each undefined function called by the executable.
    - \_\_DATA, \_\_nl\_symbol\_ptr : **Non lazy** symbol pointers. Symbol pointers for each undefined data symbol referenced by the executable.

- 详解

- \_\_DATA, \_\_bss

- Data for uninitialized static variables (for example, `static int i;` ).
    - 存储未初始化的静态量。比如：`static NSThread *_networkRequestThread = nil;`
      - 其中这里面的size表示应用运行占用的内存，不是实际的占用空间。所以计算大小的时候应该去掉这部分数据。

- \_\_DATA, \_\_common

- Uninitialized imported symbol definitions (for example, `int i;` ) located in the global scope (outside of a function declaration).
    - 存储导出的全局的数据。类似于 `static`，但是没有用 `static` 修饰
      - 比如
        - KSCrash里面 `NSDictionary* g_registerOrders;`，`g_registerOrders` 就存储在 `__common` 里面

- \_\_DATA, \_\_data

- Initialized mutable variables, such as writable C strings and data arrays.

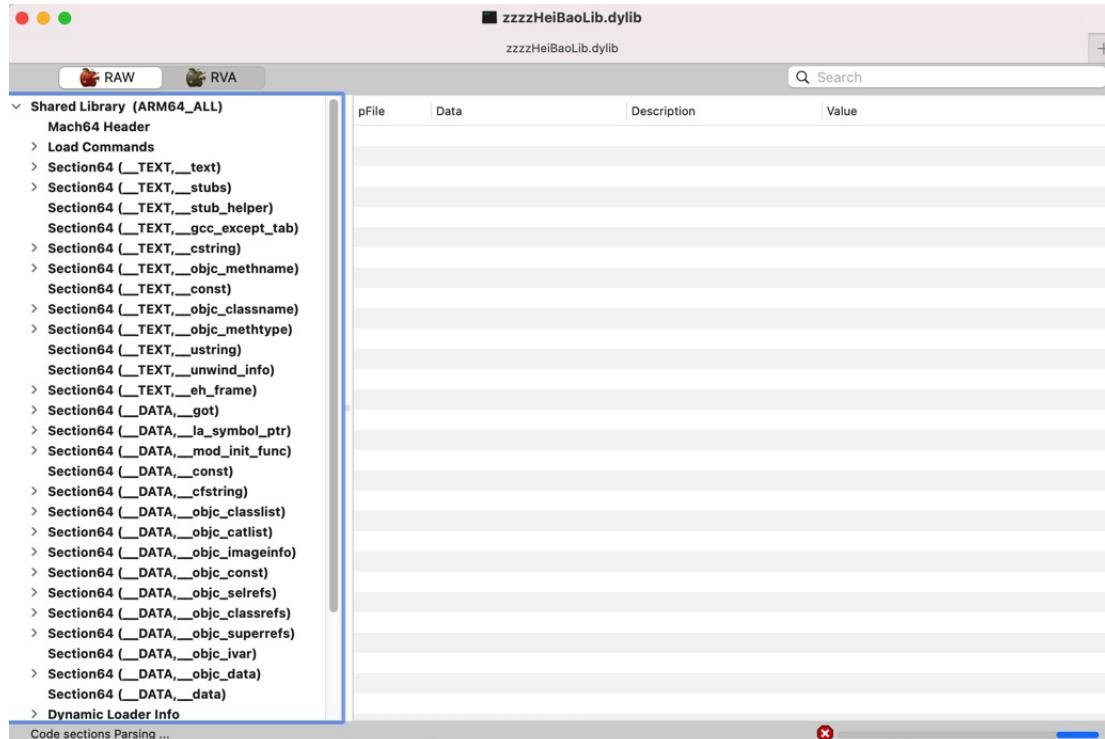

- 放了协议和一些固定了地址（已经初始化）的静态量
- `__DATA,__la_symbol_ptr`
  - Lazy symbol pointers, which are indirect references to functions imported from a different file
    - 详见: [PIC](#)
  - 懒加载的函数指针地址。和 `_stubs` 和 `_stub_helper` 配合使用
- `__DATA,__nl_symbol_ptr`
  - Non-lazy symbol pointers, which are indirect references to data items imported from a different file
    - 详见: [PIC](#)
- `__DATA,__dyld`
  - Placeholder section used by the dynamic linker.
- `__DATA,__cfstring`
  - 使用Core Foundation字符串
- `__DATA,__const`
  - Initialized relocatable constant variables.
  - 存储constant常量的数据。比如使用extern导出的const修饰的常量
- `__DATA,__mod_init_func`
  - Module initialization functions. The C++ compiler places static constructors here.
  - 模块初始化的方法
- `__DATA,__mod_term_func`
  - Module termination functions.
- `__DATA,__objc_classlist`
  - objc类列表,保存类信息, 映射了 `__objc_data` 的地址
- `__DATA,__objc_data`
  - objc的数据。用于保存类需要的数据。最主要的内容是映射 `__objc_const` 地址, 用于找到类的相关数据
- `__DATA,__objc_nlclslist`
  - Objective-C 的 `+load` 函数列表, 比 `__mod_init_func` 更早执行
- `__DATA,__objc_catlist`
  - categories
- `__DATA,__objc_nlcatlist`
  - Objective-C 的categories的 `+load` 函数列表
- `__DATA,__objc_protolist`
  - objct协议列表
- `__DATA,__objc_imageinfo`
  - objc镜像信息
- `__DATA,__got`
  - 存储引用符号的实际地址, 类似于动态符号表
- `__DATA,__objc_const`
  - objc常量。保存 `objc_classdata` 结构体数据。用于映射类相关数据的地址, 比如类名, 方法名等
- `__DATA,__objc_selrefs`
  - 引用到的objc方法
- `__DATA,__objc_protorefs`
  - 引用到的objc协议

- \_\_DATA, \_\_objc\_classrefs
  - 引用到的objc类
- \_\_DATA, \_\_objc\_superrefs
  - objc超类引用
- \_\_DATA, \_\_objc\_ivar
  - objc的 ivar 指针,存储属性

## 举例

- MachOView查看

- zzzzHeiBaoLib.dylib

- 某app

- \_\_DATA 的segment command

Offset	Data	Description	Value
000004C8	00000019	Command	LC_SEGMENT_64
000004C4	00000728	Command Size	1832
000004C8	5F5F4415441800000000000000000000	Segment Name	__DATA
000004D0	0000000103EBB000	VM Address	4360744960
000004E0	000000000003EBB000	VM Size	12488704
000004E8	000000000003EBB000	File Offset	65777664
000004F0	000000000009F1000	File Size	10424320
000004F8	00000007	Maximum VM Protection	
		00000001	VM_PROT_READ
		00000002	VM_PROT_WRITE
		00000004	VM_PROT_EXECUTE
000004FC	00000003	Initial VM Protection	
		00000001	VM_PROT_READ
		00000002	VM_PROT_WRITE
00000500	00000016	Number of Sections	22
00000504	00000000	Flags	

- 说明

- 命令类型是LC\_SEGMENT\_64
- 命令的大小1832
- segment命令的名称是\_\_DATA
- 映射的内存地址是4360744960 (十进制)
- 内存的大小12488704
- 文件的偏移量是65777664

- 需要映射的文件的大小10424320
- 最大内存保护权限：读写执行
- 初始内存权限：读写
- 这个条附属了22个 section，也就是说1832大小的segment\_command包括了22个section命令的大小。
- 看的方法：offset代表文件的便宜量、Data表示内存地址中存储的值、description表示这段内存地址的名称的描述、value表示存储的值的可视描述。
- 后续的22个section

## DATA, got

- GOT = Global Offset Table = 全局符号偏移表
  - 解释
    - iOS 开发中，动态库是个绕不开的话题，系统库基本上是动态库。它的一大优势是节约内存，可让多个程序映射同一份的动态库，实现代码共享。动态库本身也是一个 Mach-O 文件，也有数据段、代码段等。其中代码段可读可执行，数据段可读可写。
    - 动态库共享的只是代码段部分，为了达到代码段共享的目的，其符号地址在生成时就不能写死，因为它映射到每个程序中虚拟内存空间中的位置可能不一样。对于数据段部分，由于各个程序会对其进行修改，因此每个程序会单独映射一份。
    - 那么如何解决代码段共享的问题呢？聪明的人们，想出一种精妙的解决方式。通过添加一个中间层，到另一个表中去查找符号的地址。这个表就叫 got = global offset table = 全局符号偏移表，然后在运行时绑定地址信息，将地址填入到 got 中。这样代码段中的符号就与具体地址无关，只和 got 中的数据有关。这种方式就叫 PIC = Program Independent Code = 地址无关代码

## 举例

- MachOView 查看

- 某程序

## \_\_IMPORT

`__IMPORT` segment的section:

- `__IMPORT, __jump_table`
  - Stubs for calls to functions in a dynamic library.
- `__IMPORT, __pointers`
  - Non-lazy symbol pointers, which are direct references to functions imported from a different file.

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新:

2023-10-06 16:28:34

## LINKEDIT

- 用户层的完全链接后的Mach-O文件，最后一个segment是 link edit
  - 包含 link edit 信息
    - Symbol Table = 符号表
    - String Table = 字符串表
    - 等等
  - 用于：动态加载器 dynamic loader 去链接所依赖的库

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-07 17:16:38

## \_\_OBJC

- segment: \_\_OBJC
  - 相关解释
    - Objective-C是一种Reflection反射型语言，可以在运行时获取和修改自身状态，其中的实现存在于 `libobjc.A.dylib` 库中，这些“运行时”能力源于objective-c类结构组织较为灵活，并提供了操作自身结构的接口，同时在生成的可执行文件( Mach-o )中存在 `__OBJC` 段，这些节中提供了足够的类构成信息，而Mac端gdb可以解析这些结构，而正由于objc提供了如此多的信息，因此也比c++在同等情况下逆向难度低一些。

# section节

## section定义

源码定义：

```

/*
 * A segment is made up of zero or more sections. Non-MH_OBJECT files have
 * all of their segments with the proper sections in each, and padded to the
 * specified segment alignment when produced by the link editor. The first
 * segment of a MH_EXECUTE and MH_FVMLIB format file contains the mach_header
 * and load commands of the object file before its first section. The zero
 * fill sections are always last in their segment (in all formats). This
 * allows the zeroed segment padding to be mapped into memory where zero fill
 * sections might be. The gigabyte zero fill sections, those with the section
 * type S_GB_ZEROFILE, can only be in a segment with sections of this type.
 * These segments are then placed after all other segments.
 *
 * The MH_OBJECT format has all of its sections in one segment for
 * compactness. There is no padding to a specified segment boundary and the
 * mach_header and load commands are not part of the segment.
 *
 * Sections with the same section name, sectname, going into the same segment,
 * segname, are combined by the link editor. The resulting section is aligned
 * to the maximum alignment of the combined sections and is the new section's
 * alignment. The combined sections are aligned to their original alignment in
 * the combined section. Any padded bytes to get the specified alignment are
 * zeroed.
 *
 * The format of the relocation entries referenced by the reloff and nreloc
 * fields of the section structure for mach object files is described in the
 * header file <reloc.h>.
 */

        uint32_t n_strx; /* index into the string table */
    } n_un;
    uint8_t n_type; /* type flag, see below */
```

```

    uint8_t n_sect;           /* section number or NO_SECT */
    uint16_t n_desc;          /* see <mach-o/stab.h> */
    uint64_t n_value;         /* value of this symbol (or stab offset) */
};

/*
 * Symbols with a index into the string table of zero (n_un.n_strx == 0) are
 * defined to have a null, "", name. Therefore all string indexes to non null
 * names must not have a zero string index. This is bit historical information
 * that has never been well documented.
 */

/*
 * The n_type field really contains four fields:
 *     unsigned char N_STAB:3,
 *             N_PEXT:1,
 *             N_TYPE:3,
 *             N_EXT:1;
 * which are used via the following masks.
 */
#define N_STAB   0xe0  /* if any of these bits set, a symbolic debugging entry */
#define N_PEXT   0x10  /* private external symbol bit */
#define N_TYPE   0x0e  /* mask for the type bits */
#define N_EXT    0x01  /* external symbol bit, set for external symbols */

```

## 举例

- MachOView查看到的 Symbol Table

◦

- 说明

- String表的偏移量是 0xbbff8 , 翻译后是 [GMRYouHaoHuReq getRequestURL]
- 地址是 0x100003300

## string

- String Table
  - String表顺序列出了二进制mach-O文件中的所有可见字符串。串之间通过0x00分隔。可以通过相对String表起始位置的偏移量随机访问String表中的字符串。符号表结构中的n\_strx指定的就是String表中的偏移量。通过这个偏移量可以访问到符号对应的具体字符串

## 举例

- MachOView查看到的某 String Table
  - 说明
    - String表的 0xbbf8 处是不是 [GMRYouHaoHuoReq getRequestURL] , string表的地址是 0x049C6D40 加上偏移量 0x000BBFB1 , 等于 0x54d633d
    - 可以看出string表的 0x54d633d 地址出就是: [GMRYouHaoHuoReq getRequestURL]

# FAT

- FAT
  - 名称
    - Fat Binary = 胖二进制
    - = Fat File = 胖二进制文件
    - = Universal Binary = 通用二进制
  - 含义：把多个架构的二进制（比如 armv7、arm64 等）合并在一起，成了个胖子，所以叫 Fat Binary
    - 一个由不同的编译架构后的 Mach-O 产物所合成的集合体
    - 一个架构的 Mach-O 只能在相同架构的机器或者模拟器上用
    - 为了支持不同架构需要一个集合体
  - 文件大小
    - 一般比单一架构的文件要大
    - 但是由于多架构会共用一部分资源，所以往往比多个（常常是2个）的总大小要小

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-05 16:43:09

## FAT举例

### 用MachOView查看

#### RevealServer

Offset	Data	Description	Value
00000000	BEBAFECA	Magic Number	FAT_CIGAM
00000004	05000000	Number of Architecture	5
00000008	07000000	CPU Type	CPU_TYPE_I386
0000000C	03000000	CPU SubType	CPU_SUBTYPE_I386_ALL
00000010	00100000	Offset	4096
00000014	20571000	Size	1070880
00000018	0C000000	Align	4096
0000001C	07000001	CPU Type	CPU_TYPE_X86_64
00000020	03000000	CPU SubType	CPU_SUBTYPE_X86_64_ALL
00000024	00701000	Offset	1077248
00000028	90101200	Size	1183888
0000002C	0C000000	Align	4096
00000030	0C000000	CPU Type	CPU_TYPE_ARM
00000034	09000000	CPU SubType	CPU_SUBTYPE_ARM_V7
00000038	00C02200	Offset	2277376
0000003C	D0854400	Size	4490704
00000040	0E000000	Align	16384
00000044	0C000001	CPU Type	CPU_TYPE_ARM64
00000048	00000000	CPU SubType	CPU_SUBTYPE_ARM64_ALL
0000004C	00806700	Offset	6782976
00000050	D03A4700	Size	4668112
00000054	0E000000	Align	16384
00000058	0C000001	CPU Type	CPU_TYPE_ARM64
0000005C	02000000	CPU SubType	???
00000060	00C0AE00	Offset	11452416
00000064	90041200	Size	1180816
00000068	0E000000	Align	16384

### 用file查看

可以用 `file` : 查看Mach-O的文件类型

- 语法: `file inputMacOFile`

### RevealServer

```
crifan@licrifandeMacBook-Pro ~ ~/dev/dev_tool/reverse_security/iOS/Tweak/Reveal2Loader/lemon4ex file Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer: Mach-O universal binary with 5 architectures: [i386:Mach-O dynamically linked shared library i386] [x86_64] [arm_v7] [arm64] [arm64e]
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer (for architecture i386):      Mach-O dynamically linked shared library i386
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer (for architecture x86_64):      Mach-O 64-bit dynamically linked shared library x86_64
```

```
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer (for architecture armv7): Mach-O dynamically linked shared library arm_v7  
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer (for architecture arm64): Mach-O 64-bit dynamically linked shared library arm64  
Reveal2Loader/Reveal2Loader/Package/Library/Frameworks/RevealServer.framework/RevealServer (for architecture arm64e): Mach-O 64-bit dynamically linked shared library arm64e
```

## rsync

```
→ ~ which rsync  
/usr/bin/rsync  
→ ~ file /usr/bin/rsync  
/usr/bin/rsync: Mach-O universal binary with 2 architectures: [x86_64:Mach-O 64-bit executable x86_64] [arm64e:Mach-O 64-bit executable arm64e]  
/usr/bin/rsync (for architecture x86_64): Mach-O 64-bit executable x86_64  
/usr/bin/rsync (for architecture arm64e): Mach-O 64-bit executable arm64e
```

## adb

```
→ platform-tools pwd  
/Users/crifan/dev/dev_tool/android/AndroidSDK/platform-tools  
→ platform-tools ll  
total 49520  
..  
-rwxr-xr-x@ 1 crifan staff 13M 7 24 15:26 adb  
..  
→ platform-tools file adb  
adb: Mach-O universal binary with 2 architectures: [x86_64:Mach-O 64-bit executable x86_64] [arm64]  
adb (for architecture x86_64): Mach-O 64-bit executable x86_64  
adb (for architecture arm64): Mach-O 64-bit executable arm64
```

## lldb

```
→ ~ file /usr/bin/lldb  
/usr/bin/lldb: Mach-O universal binary with 2 architectures: [x86_64:Mach-O 64-bit executable x86_64] [arm64e:Mach-O 64-bit executable arm64e]  
/usr/bin/lldb (for architecture x86_64): Mach-O 64-bit executable x86_64  
/usr/bin/lldb (for architecture arm64e): Mach-O 64-bit executable arm64e
```

## debugserver

```
crifan@licrifandeMacBook-Pro:~/dev/dev_root/iosReverse/AppleStore/fromiPhone8/Developer/usr/bin" ll  
total 5240  
-rw-r--r-- 1 crifan staff 832B 3 3 11:48 debugable_entitlement.xml  
-rwxrwxr-x 1 crifan staff 1.3M 8 8 2021 debugserver  
-rwxr-xr-x 1 crifan staff 1.3M 3 3 11:49 debugserver_debugable
```

```
crifan@licrifandeMacBook-Pro: ~/dev/dev_root/iosReverse/AppleStore/fromiPhone8/Developer/usr/bin" file debugserver
debugserver: Mach-O universal binary with 2 architectures: [arm64:Mach-O 64-bit executable arm64] [arm64e:Mach-O 64-bit executable arm64e]
debugserver (for architecture arm64):      Mach-O 64-bit executable arm64
debugserver (for architecture arm64e):      Mach-O 64-bit executable arm64e
```

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新:  
2023-10-07 17:54:17

## FAT常见问题

### Select an architecture setting the ARCH= environment variable

用jtool2导出Mask的dylib信息期间就遇到了 FAT Binary :

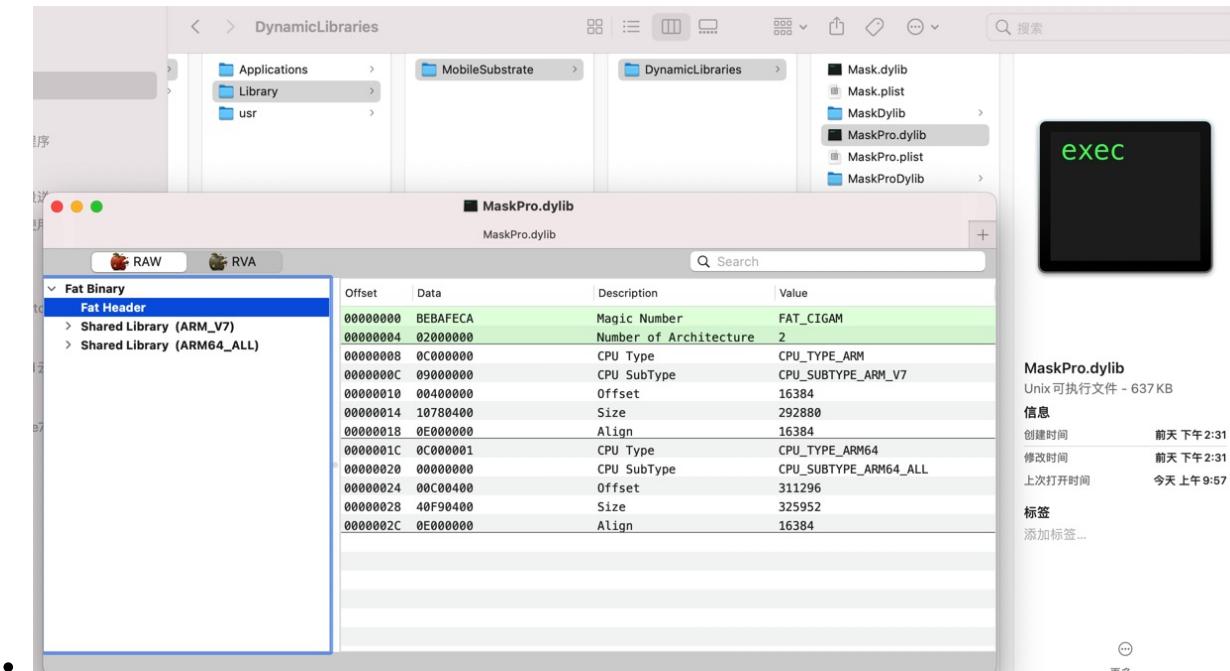

```
→ DynamicLibraries jtool2 -h MaskPro.dylib > MaskProDylib/MaskProDylib_jtool2_h_header.txt
Fat binary, little-endian, 2 architectures: armv7, arm64
Select an architecture setting the ARCH= environment variable
```

即，一个Dylib中，包含了多种架构，此处是 armv7 和 arm64

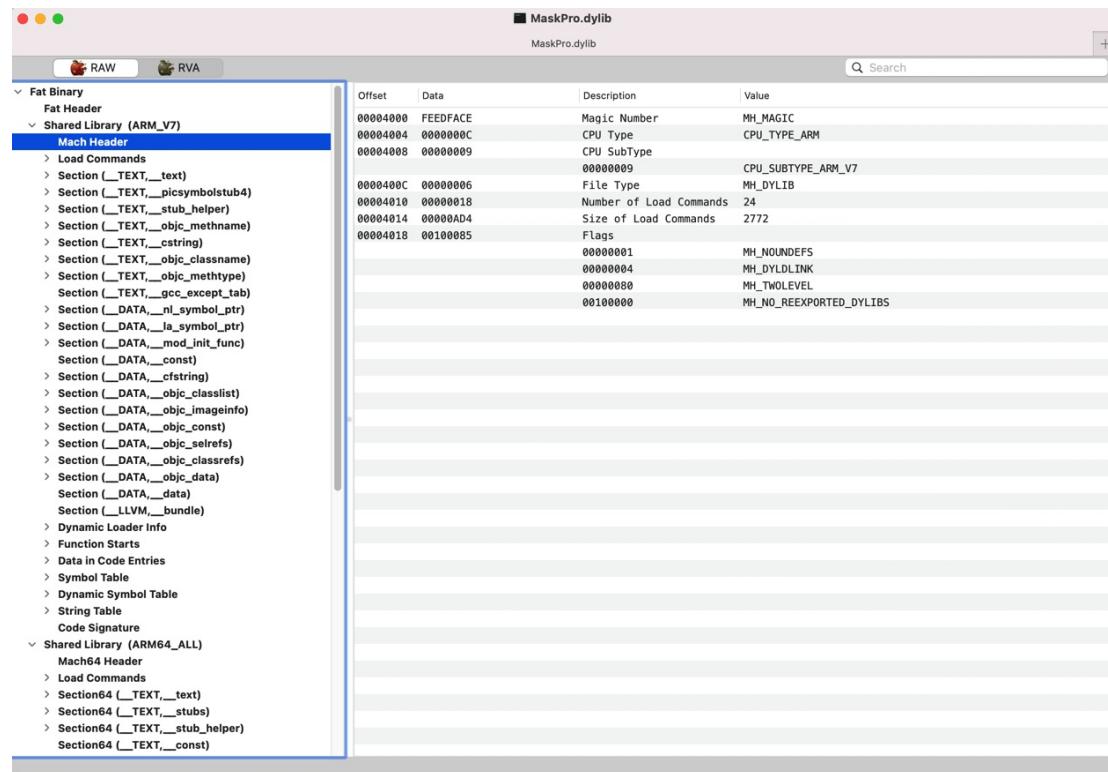

此处要指定具体架构，才能继续用 jtool2 查看信息：

```
→ DynamicLibraries export ARCH=arm64
→ DynamicLibraries jtool2 -h MaskPro.dylib > MaskProDylib/MaskProDylib_jtool2_h_header.txt
```

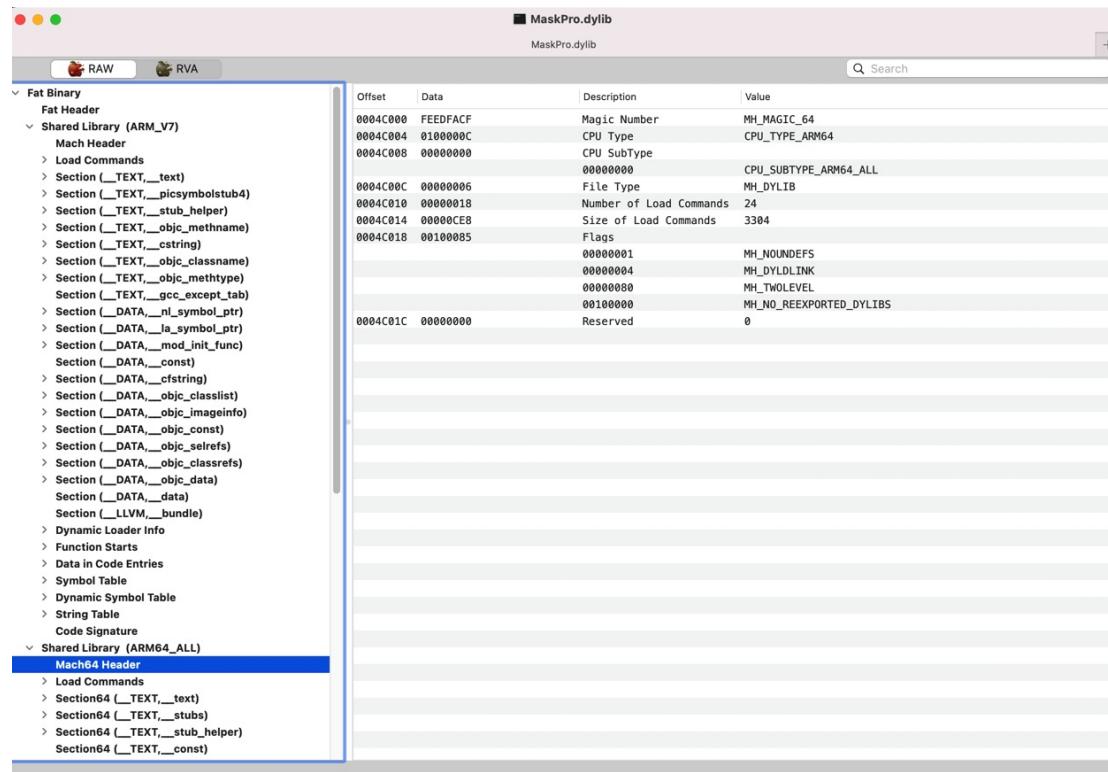

类似的，后续去用 MachOView 查看信息，也能看到是：FAT Binary

- ARMV7

- ARM64

crifan.org, 使用署名4.0国际(CC BY 4.0)协议发布 all right reserved, powered by Gitbook最后更新:

2023-10-05 16:43:30

## FAT工具

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-05 16:43:41

## lipo

- lipo : 常用于多架构Mach-O文件的处理
  - 查看架构信息

```
lipo -info inputMacOFile
```

- 导出某种特定架构

```
lipo inputMacOFile -thin ArchType -output OutputFile
```

- 合并多种架构

```
lipo inputMacOFile1 inputMacOFile2 -output OutputFile
```

## 举例

- 瘦身=导出单个架构
  - 导出arm64架构

```
lipo -thin arm64 debugserver_orig -output debugserver_arm64
```

其中， `arm64` 是从 `file` 中查看到包含的多个架构中的其中一个：

```
crifan@licrifandeMacBook-Pro ~ ~/dev/dev_root/iosReverse/AppleStore/dynamicDebug/debugserver_lldb" file fromiPhone11/debugserver_orig
fromiPhone11/debugserver_orig: Mach-O universal binary with 2 architectures: [arm64:Mach-O 64-bit executable arm64] [arm64e:Mach-O 64-bit executable arm64e]
fromiPhone11/debugserver_orig (for architecture arm64):      Mach-O 64-bit executable arm64
fromiPhone11/debugserver_orig (for architecture arm64e):      Mach-O 64-bit executable arm64e
```

## codesign

### CODE SIGNATURE

<https://developer.apple.com/library/mac/documentation/Security/Conceptual/CodeSigningGuide/RequirementLang/RequirementLang.html>

### CODE SIGNATURES: BLOBS ON BLOBS ON BLOBS...

```
/*
 * Blob types (magic numbers) for blobs used by Code Signing.
 */
enum {
    kSecCodeMagicRequirement =      0xfade0c00, /* single requirement */
    kSecCodeMagicRequirementSet =   0xfade0c01, /* requirement set */

2023-10-05 23:13:30

# 虚拟地址

- 关于虚拟地址
  - Mach-O中相关定义: `segment`段 和 `section`节 中的部分定义
    - `segment_command_64` 中有对应字段
      - `vmaddr`
        - VM Address = 虚拟内存地址
        - 当程序被加载到内存中后, 对应的(虚拟)内存地址
        - 注: 现代CPU都支持(映射后的)虚拟内存
      - `vmsize`
        - 虚拟内存中的程序大小
        - 目前所见过的所有情况中, 此值都是和文件大小一样
      - `section_64`
        - `addr`
          - 虚拟内存地址
          - 不是我们从硬盘中读取的偏移量地址
        - `size`
          - 大小, 单位是字节
          - 适用于虚拟内存地址和文件偏移量
        - `offset`
          - (磁盘中的)文件内的偏移量
- 一般来说:
  - 有2个偏移量=地址
    - 虚拟内存 = `vm`
    - 文件 = `file`
  - 对应分别常被简称为
    - `vmoff`
    - `fileoff`
  - 举例
    - 最开始的起始地址
      - `fileoff` = `0x0`
      - `vmoff` = `0x100000000`
        - 程序常被映射到虚拟内存地址`0x100000000`
- 进一步说:
  - 其实有3个常见地址相关名词
    - `VA` = Virtual Address = 虚拟地址
      - == VM Address = 虚拟内存地址
    - `RVA` = Relative Virtual Address = 相对的虚拟地址
      - 相对于谁: `ImageBase` = 二进制镜像文件的基地址
    - `File Offset` = 文件内偏移量
      - `file_off` = (`address` - `seg.address`) + `seg.offset`
  - 举例

- Virtual Address = 0x00401000
  - ImageBase = 0x00400000
  - RVA = 0x00001000
- MachOView中能看到:
  - 2种显示模式
    - RAW =原始地址=虚拟地址
    - RVA =相对虚拟地址 = 类似于 VA 的概念
  - 比如: baseAddress = 基地址 = VM Address = 虚拟内存地址
    - 址 : 0x100000000
    - File Offset 地址: 0xA0460 -> 变成了 RVA 地址: 0x1000A0460

### ■ 举例

#### ■ akd

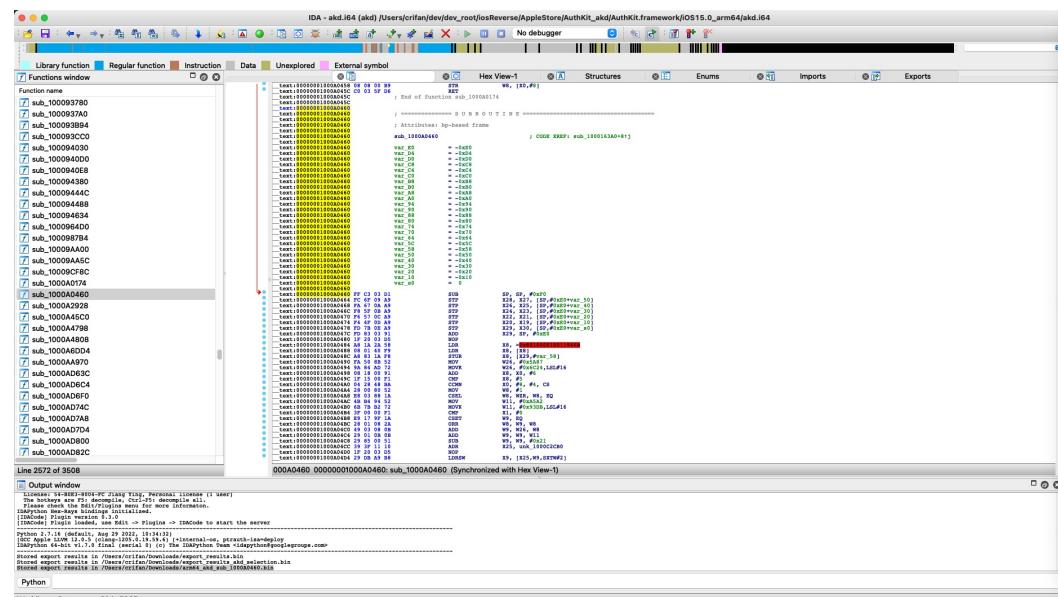

#### ■ RAW

Offset	Data	Description	Value

## Mach-O大小限制

Apple会对iOS的app的大小做一定的限制，防止太大，影响用户下载（的体验）。

### iOS的app的大小限制历史

若下载大小超过限制，将无法使用蜂窝网络下载App（ios 13之前），会收到文件容量太大的提示，需通过Wi-Fi网络下载。如下，为苹果历年来对App下载大小限制的变化情况：

- 2008年7月，搭载了App Store的iPhone 3G正式发售，下载限制仅为10 MB
- 2010年2月，苹果将iPhone 3G的下载限制从10 MB提升到20 MB
- 2012年3月，iOS 5.1正式版后，下载限制从20 MB提升到50 MB
- 2013年9月，iOS 7正式版后，下载限制从50 MB提升至100 MB
- 2017年9月，iOS 11正式版后，下载限制从100 MB提升至150 MB
- 2019年5月，下载限制从150 MB提升至200 MB
- 2019年9月，iOS 13正式版后，若下载大小超过200 MB，用户可选择是否使用蜂窝网络下载

如今，App下载大小超出200 MB时，会出现两种情况：

- iOS 13以下的用户，无法通过蜂窝数据下载App
- 
- iOS 13及以上的用户，需要手动设置才可以使用蜂窝网络下载App

◦

## Mach-O可执行文件大小限制

苹果对可执行文件大小亦有明确限制，超过该限制会导致 App 审核被拒：

ERROR: ERROR ITMS-90122: "Invalid Executable Size. The size of your app's executable file 'News.app/News' is 68534272 bytes for architecture 'arm64', which exceeds the maximum allowed size of 60 MB."

具体限制如下：

- iOS <7.0 : 二进制文件中所有的 `__TEXT` 段总和不得超过**80 MB**
- iOS 7.x ~ iOS 8.x : 二进制文件中，每个特定架构中的 `__TEXT` 段不得超过**60 MB**
- iOS >9.0 : 二进制文件中所有的 `__TEXT` 段总和不得超过**500 MB**

# MachOView

- MachOView

- 是什么：查看和编辑 x86 / ARM 的 Mach-O 二进制文件的工具
  - Visual Mach-O file browser that allows exploring and in-place editing Intel and ARM binaries.
- 用途：常用来查看iOS的app的二进制文件的信息
- 截图

- 资料

- 最早好像是在sourceforge
  - MachOView download | SourceForge.net
    - <https://sourceforge.net/projects/machoview/>
- 后来有人fork到GitHub
  - gdbinit/MachOView: MachOView fork
    - <https://github.com/gdbinit/MachOView>
- 现在有国人fork后继续维护
  - fangshufeng/MachOView: 分析Macho必备工具
    - <https://github.com/fangshufeng/MachOView>

## 下载和安装MachOView

- 下载

从[fangshufeng/MachOView: 分析Macho必备工具](https://github.com/fangshufeng/MachOView), 进入此时最新版Release 2.6.1去下载

[MachOView-2.6.1.dmg](#)

- 安装

下载后, 双击 `dmg`, 打开窗口, 把其中的 `MachOView.app` 拷贝到 应用程序 即可:

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-07 15:38:16

## MachOView用法举例

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-07 15:30:06

## main\_arm64

用MachOView去查看这个 main\_arm64: Mach-O 64-bit executable arm64

### Mach64 Header

	Offset	Data	Description	Value
	00000000	FEEDFACF	Magic Number	MH_MAGIC_64
	00000004	0100000C	CPU Type	CPU_TYPE_ARM64
	00000008	00000000	CPU SubType	
		00000000	CPU_SUBTYPE_ARM64_ALL	
	0000000C	00000002	File Type	MH_EXECUTE
	00000010	00000011	Number of Load Commands	17
	00000014	000005B8	Size of Load Commands	1464
	00000018	00200085	Flags	
		00000001	MH_NOUNDEFS	
		00000004	MH_DYLDLINK	
		00000080	MH_TWOLEVEL	
		00200000	MH_PIE	
	0000001C	00000000	Reserved	0

内容：

- Mach64 Header
  - MH\_MAGIC\_64
  - CPU\_TYPE\_ARM64
  - CPU\_SUBTYPE\_ARM64\_ALL
  - MH\_EXECUTE
- Number for Load Commands: 17
- Flags
  - MH\_NOUNDEFS
  - MH\_DYLDLINK
  - MH\_TWOLEVEL
  - MH\_PIE
- Reserved: 0

## Load Commands

main\_arm64

The screenshot shows the Binary Ninja interface with the file "main\_arm64" open. The left pane displays a hierarchical tree of load commands under the "Executable (ARM64\_ALL)" section. The "Load Commands" section is currently selected. The right pane shows a table with four columns: pFile, Data LO, Data HI, and Value. The table lists numerous entries, each corresponding to a specific load command. The first few entries are:

pFile	Data LO	Data HI	Value
00000020	19 00 00 00 48 00 00 00	5F 5F 50 41 47 45 5A 45	....H..._PAGEZE

### LC\_SEGMENT\_64 ( \_\_PAGEZERO )

main\_arm64

The screenshot shows the lief debugger interface with the file 'main\_arm64' loaded. The left pane displays a tree view of the Mach-O header and load commands. The 'Load Commands' section is expanded, and the 'LC\_SEGMENT\_64 ( \_\_TEXT )' command is selected, highlighted with a blue border. The right pane shows a table of detailed information for this command.

Offset	Data	Description	Value
00000020	00000019	Command	LC_SEGMENT_64
00000024	00000048	Command Size	72

\_\_DATA, \_\_la\_symbol\_ptr

main\_arm64

The screenshot shows the Binary Ninja interface with the file 'main\_arm64' loaded. On the left, the navigation pane displays the Mach-O header structure. The 'Executable (ARM64\_ALL)' section is expanded, showing various load commands like LC\_SEGMENT\_64, LC\_DYLD\_INFO\_ONLY, and LC\_CODE\_SIGNATURE. The 'Section64 Header (\_la\_symbol\_ptr)' command is selected. On the right, the section table is displayed as a table:

Offset	Data	Description	Value
00000320	5F5F6C615F73796D626F6C5F70747200	Section Name	_la_symbol_ptr
00000330	5FF441544100000000000000000000000	Segment Name	__DATA
00000340	000000100008000	Address	4295000064

## LC\_SEGMENT\_64 ( \_\_LINKEDIT )

Screenshot of the Binary Ninja debugger showing the Mach-O header structure of a file named "main\_arm64". The left pane displays the command list, and the right pane shows detailed memory dump information.

Offset	Data	Description	Value
00000410	00000019	Command	LC_SEGMENT_64
00000414	00000048	Command Size	72
00000418	5F5F4C494E4B45444954000000000000	Segment Name	__LINKEDIT
00000428	000000010000C000	VM Address	4295016448
00000430	0000000000004000	VM Size	16384
00000438	000000000000C000	File Offset	49152
00000440	0000000000004C7	File Size	1223
00000448	00000001	Maximum VM Protection	00000001
		VM PROT_READ	
0000044C	00000001	Initial VM Protection	00000001
		VM PROT_READ	
00000450	00000000	Number of Sections	0
00000454	00000000	Flags	

## LC\_DYLD\_INFO\_ONLY

Screenshot of the Binary Ninja debugger showing the Load Commands section for the main\_arm64 executable.

The left pane displays a tree view of the Load Commands:

- Executable (ARM64\_ALL)
- Mach64 Header
- Load Commands
  - LC\_SEGMENT\_64 (\_\_PAGEZERO)
  - LC\_SEGMENT\_64 (\_\_TEXT)
  - LC\_SEGMENT\_64 (\_\_DATA\_CONST)
  - LC\_SEGMENT\_64 (\_\_DATA)
    - Section64 Header (\_\_la\_symbol\_ptr)
    - Section64 Header (\_\_data)
    - Section64 Header (\_\_common)
  - LC\_SEGMENT\_64 (\_\_LINKEDIT)
  - LC\_DYLD\_INFO\_ONLY**
  - LC\_SYMTAB
  - LC\_DYSYMTAB
  - LC\_LOAD\_DYLINKER
  - LC\_UID
  - ??? (unsupported)
  - LC\_SOURCE\_VERSION
  - LC\_MAIN
  - LC\_LOAD\_DYLIB (libSystem.B.dylib)
  - LC\_FUNCTION\_STARTS
  - LC\_DATA\_IN\_CODE
  - LC\_CODE\_SIGNATURE
  - > Section64 (\_\_TEXT,\_\_text)
  - > Section64 (\_\_TEXT,\_\_stubs)
  - > Section64 (\_\_TEXT,\_\_stub\_helper)
  - > Section64 (\_\_TEXT,\_\_cstring)
  - Section64 (\_\_TEXT,\_\_ unwind\_info)
  - > Section64 (\_\_DATA\_CONST,\_\_got)
  - > Section64 (\_\_DATA,\_\_la\_symbol\_ptr)
  - Section64 (\_\_DATA,\_\_data)
  - > Dynamic Loader Info
  - > Function Starts
  - > Symbol Table
    - Data in Code Entries
    - > Dynamic Symbol Table
    - > String Table
    - Code Signature

The right pane shows a table of Load Commands:

Offset	Data	Description	Value
00000458	80000022	Command	LC_DYLD_INFO_ONLY
0000045C	00000030	Command Size	48
00000460	0000C000	Rebase Info Offset	49152
00000464	00000008	Rebase Info Size	8
00000468	0000C008	Binding Info Offset	49160
0000046C	00000018	Binding Info Size	24
00000470	00000000	Weak Binding Info Offset	0
00000474	00000000	Weak Binding Info Size	0
00000478	0000C020	Lazy Binding Info Offset	49184
0000047C	00000040	Lazy Binding Info Size	64
00000480	0000C060	Export Info Offset	49248
00000484	00000090	Export Info Size	144

## LC\_SYMTAB

main\_arm64

Offset	Data	Description	Value
00000488	00000002	Command	LC_SYMTAB
0000048C	00000018	Command Size	24

## LC\_UUID

main\_arm64

The screenshot shows the Mach-O dump tool interface. On the left is a tree view of the Mach-O header sections. The 'LC\_UUID' section is selected and highlighted in blue. On the right is a table view showing the details of the selected section.

Offset	Data	Description	Value
00000510	0000001B	Command	LC_UUID
00000514	00000018	Command Size	24
00000518	204745F226AC32F7B23576DAEC17F5D9	UUID	204745F2-26AC-32F7-B235-76DAEC17F5D9

**??? (unsupported)**

prFile	Data LO	Data HI	Value
00000528	32 00 00 00 20 00 00 00	01 00 00 00 00 00 0B 00	2... .....
00000538	00 01 0C 00 01 00 00 00	03 00 00 00 00 00 C7 02	.....

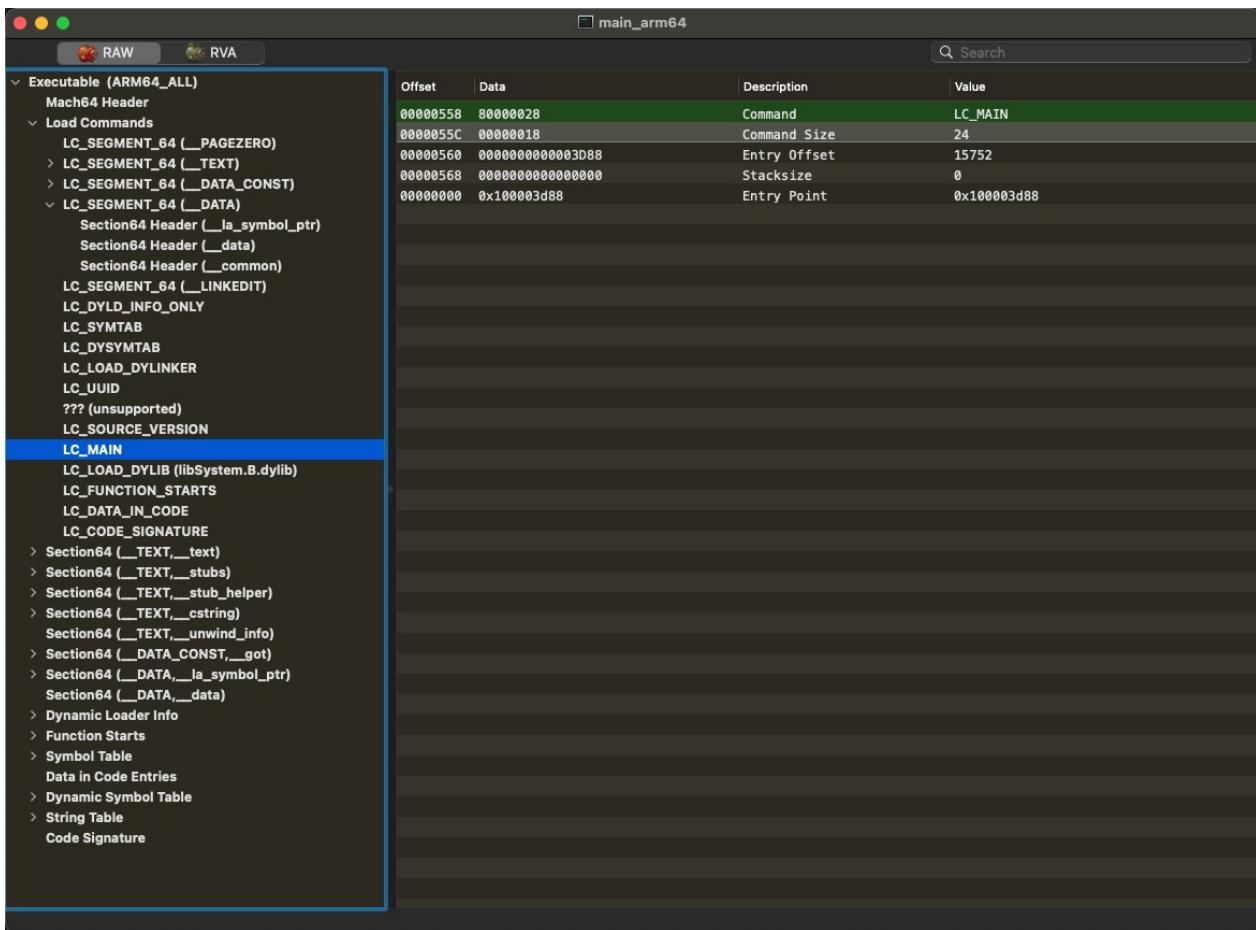

## LC\_SOURCE\_VERSION

main\_arm64

The screenshot shows the Mach-O dump tool interface. On the left, a tree view displays various load commands. The 'LC\_SOURCE\_VERSION' command is selected and highlighted with a blue border. On the right, a table provides detailed information about this command.

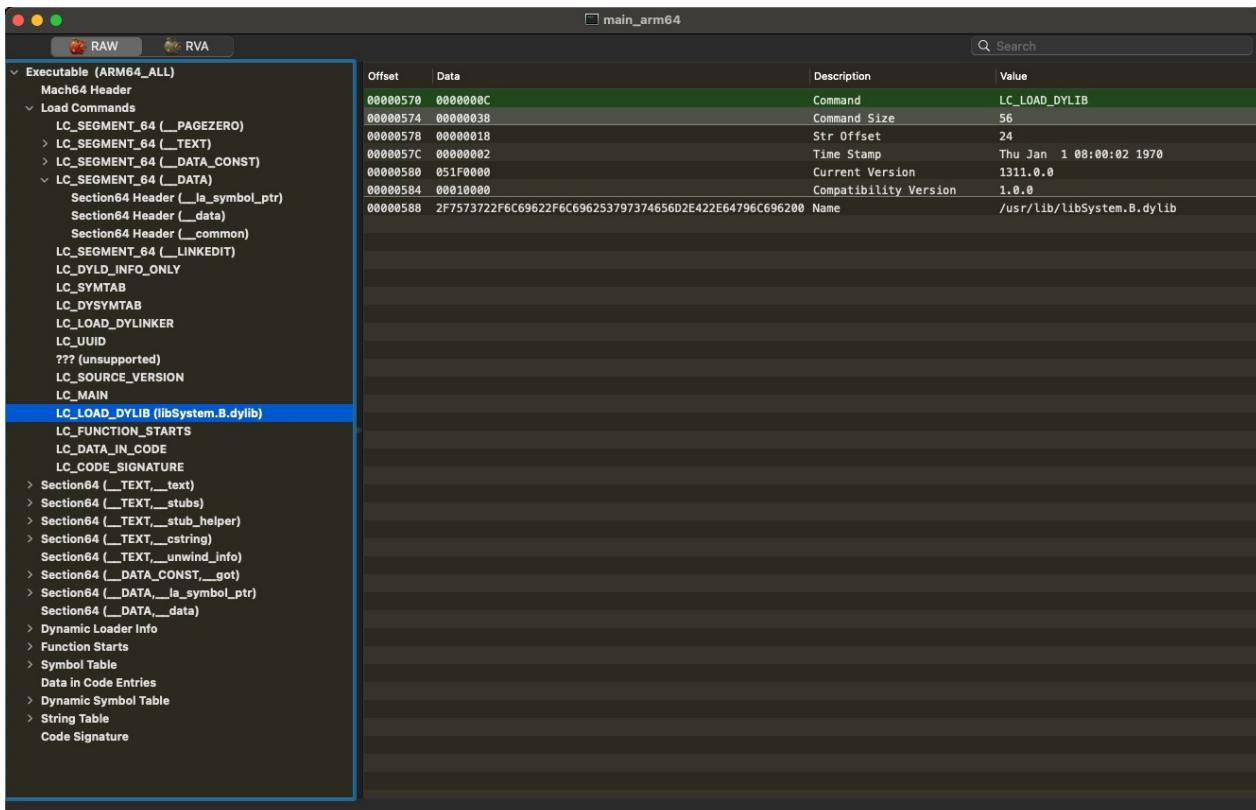

Offset	Data	Description	Value
00000548	0000002A	Command	LC_SOURCE_VERSION
0000054C	00000010	Command Size	16
00000550	0000000000000000	Version	0.0

## LC\_MAIN

估计就是 入口函数 入口地址 = 一般叫做 main函数的地方了

## LC\_LOAD\_DYLIB (libSystem.B.dylib)

## LC\_FUNCTION\_STARTS

Screenshot of the Mach-O debugger showing the Load Commands section for an executable. The 'LC\_FUNCTION\_STARTS' command is selected.

Offset	Data	Description	Value
000005A8	00000026	Command	LC_FUNCTION_STARTS
000005AC	00000010	Command Size	16
000005B0	0000C0F0	Data Offset	49392
000005B4	00000008	Data Size	8

好像是：需要启动运行的函数的列表？

## LC\_DATA\_IN\_CODE

Screenshot of the Mach-O debugger showing the Load Commands section for an executable. The 'LC\_DATA\_IN\_CODE' command is selected.

Offset	Data	Description	Value
000005B8	00000029	Command	LC_DATA_IN_CODE
000005BC	00000010	Command Size	16
000005C0	0000C0F8	Data Offset	49400
000005C4	00000000	Data Size	0

## LC\_CODE\_SIGNATURE

Screenshot of the Mach-O dump tool showing the LC\_CODE\_SIGNATURE command.

Offset	Data	Description	Value
000005C8	0000001D	Command	LC_CODE_SIGNATURE
000005CC	00000010	Command Size	16
000005D0	0000C2B0	Data Offset	49840
000005D4	00000217	Data Size	535

The left sidebar shows the command structure:

## Section64 ( \_\_TEXT, \_\_stubs )

- Symbol Stubs

好像是：

stub=表示 桩， 地基

表示， 代码运行前， 要打地基 = 做好准备

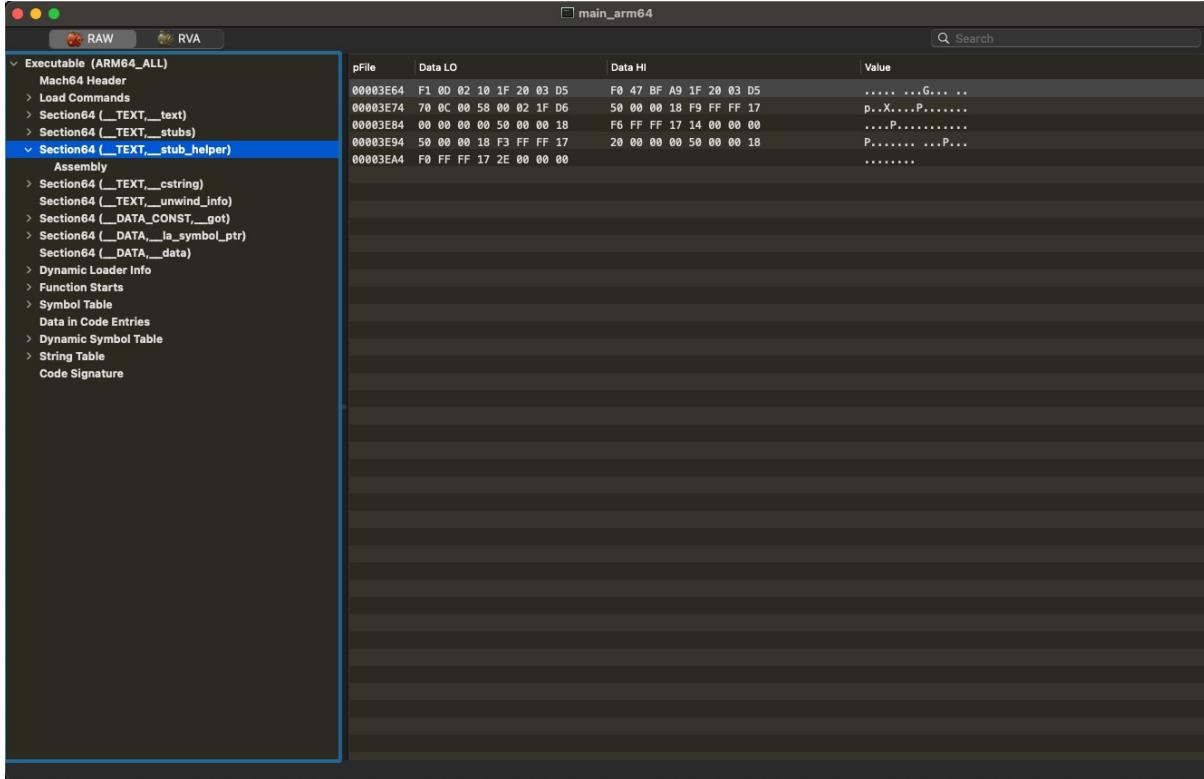

所以此处表示： 所引用的外部的函数

此处分别是：

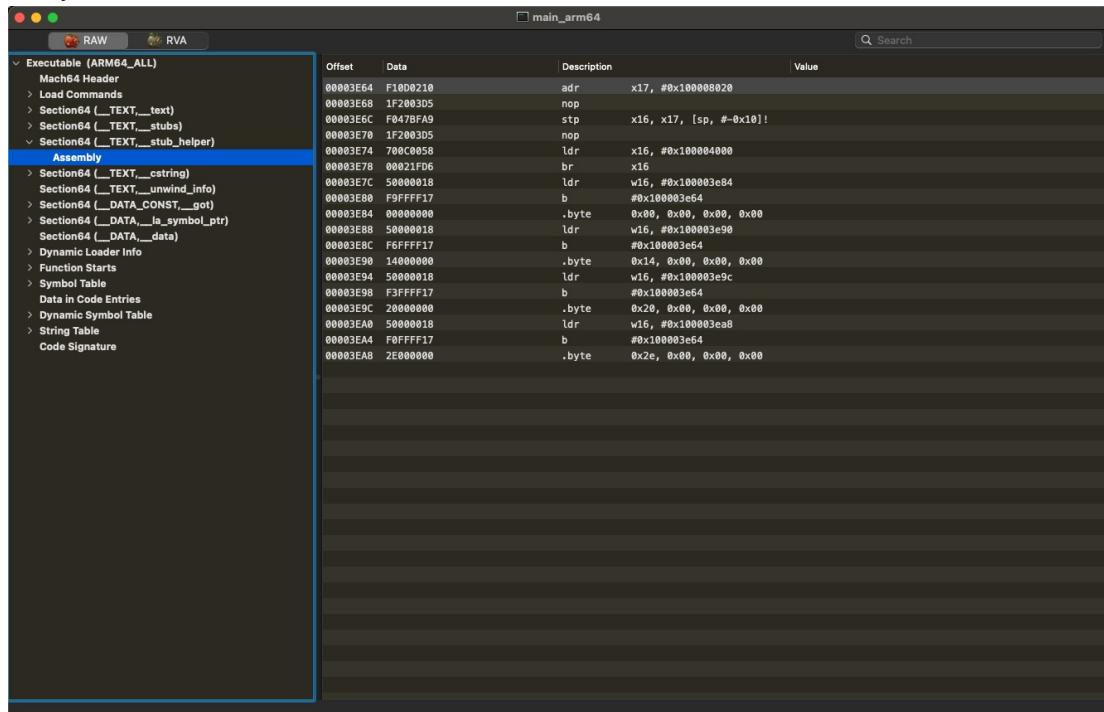

- `__strcpy_chk`

- `_free`
- `_malloc`
- `_printf`

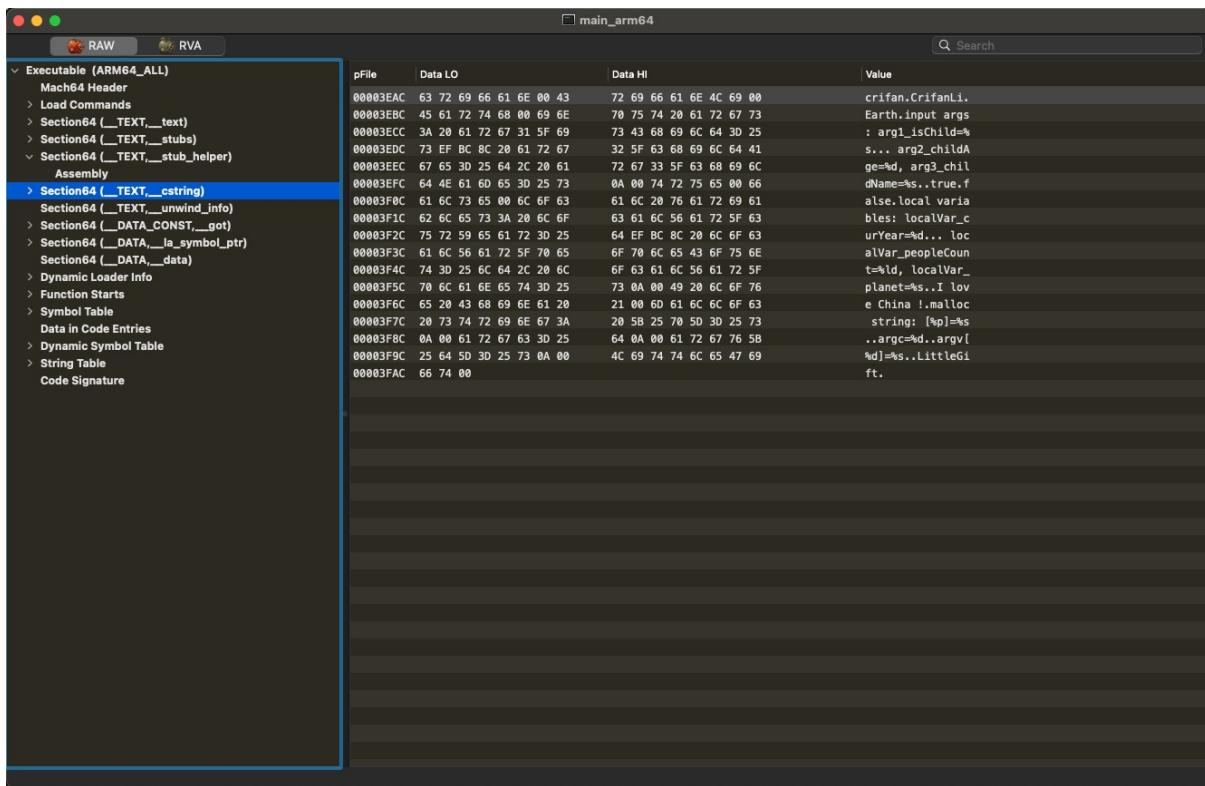

## Section64 ( `__TEXT,__stub_helper` )

- Assembly

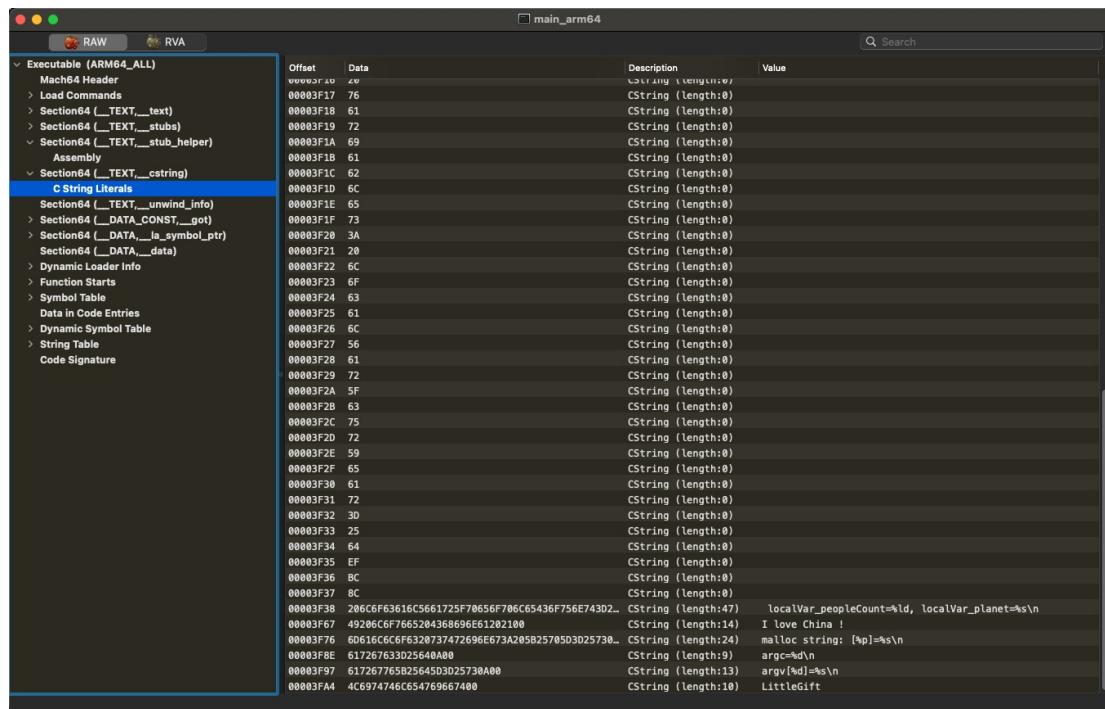

## Section64 ( `__TEXT,__cstring` )

## ■ Actions

	Offset	Data	Description	Value
	0000C057	NO SECTION	0x1000000000	_mh_execute_header
	0000C084	__TEXT __text	0x100003088	_main
	0000C093	__TEXT __text	0x100003094	_subfunc2
	0000C096	__TEXT __text	0x100003C34	_subfunc1
	0000C0AA	__DATA __data	0x100000028	_gAuthor
	0000C0B2	__DATA __data	0x100000030	_gFullName
	0000C0BC	__DATA __data	0x100000038	_gCurDate
	0000C0C6	__DATA __common	0x10000003C	_gInputArgsCount

对应原先代码中的，全局变量：

```
// demo Data segment
const char* gAuthor = "crifan"; // demo const string, place where?
char* gFullName = "CrifanLi"; // demo non-const string, place where?
int gInputArgsCount; // demo uninitialized data
int gCurDate = 20230419; // demo initialized data
```

好像还额外去导出了这些全局变量？

## MachOView用法举例：AwemeCore

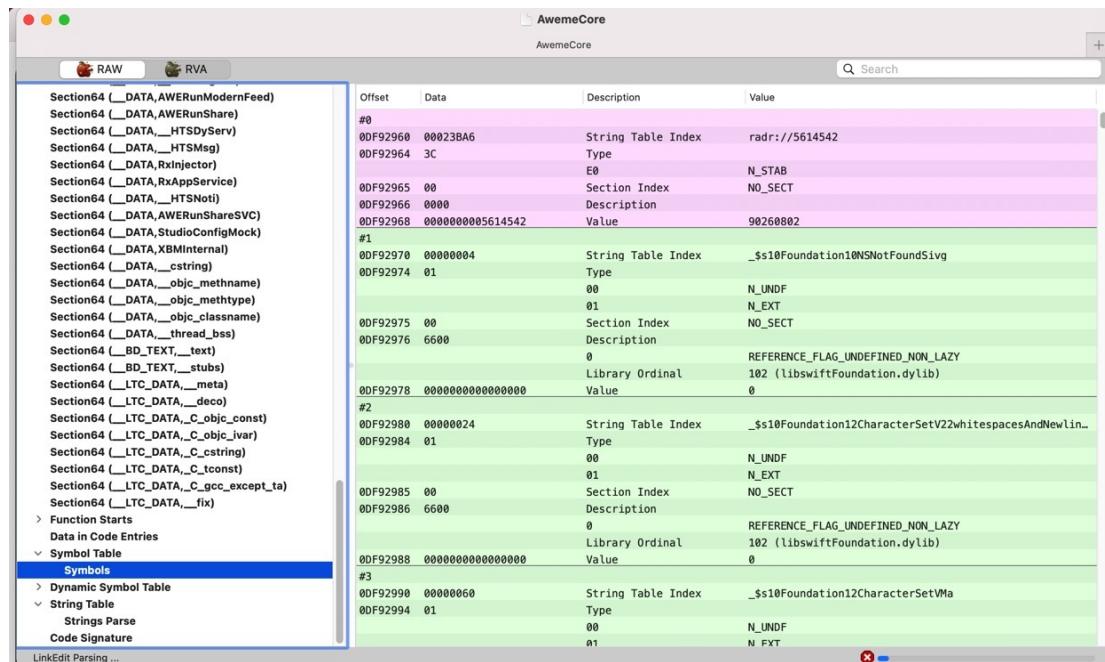

- Mach64 Header

◦

- Symbol Table

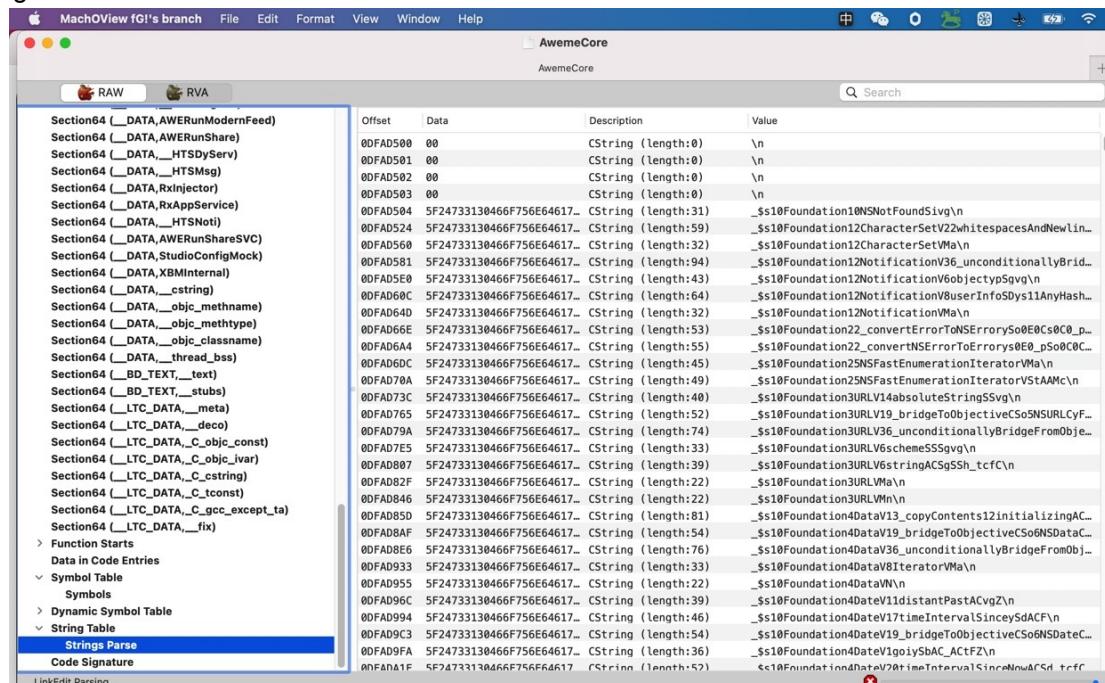

◦

- Symbols

- String Table

- Strings Parse

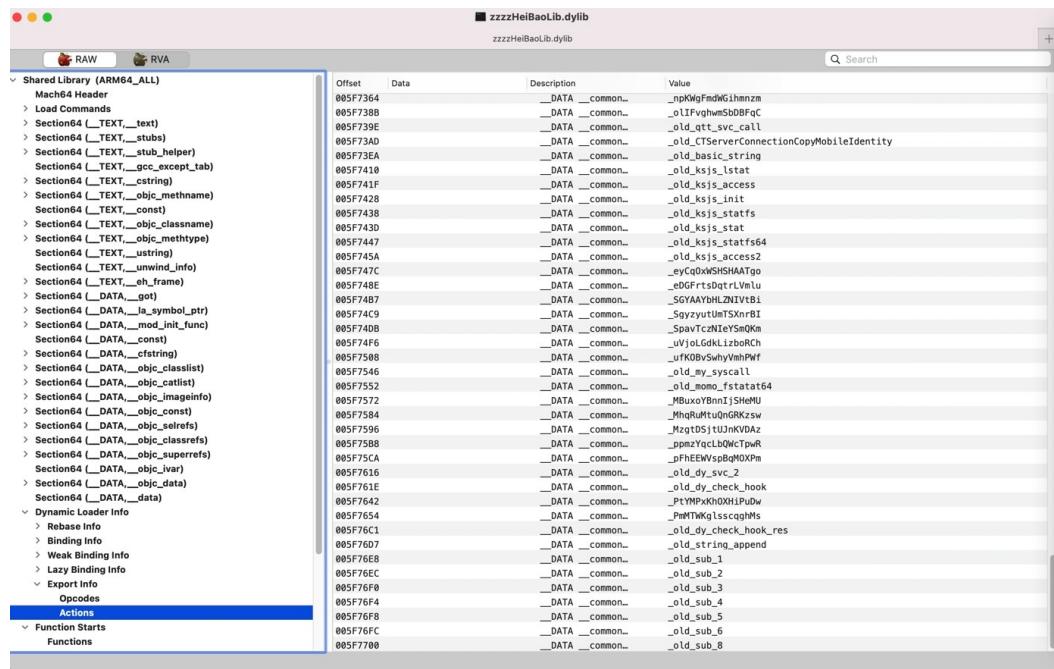

crifan.org, 使用署名4.0国际(CC BY 4.0)协议发布 all right reserved, powered by Gitbook最后更新：  
2023-10-07 23:23:00

## MachOView用法举例：zzzzHeiBaoLib.dylib

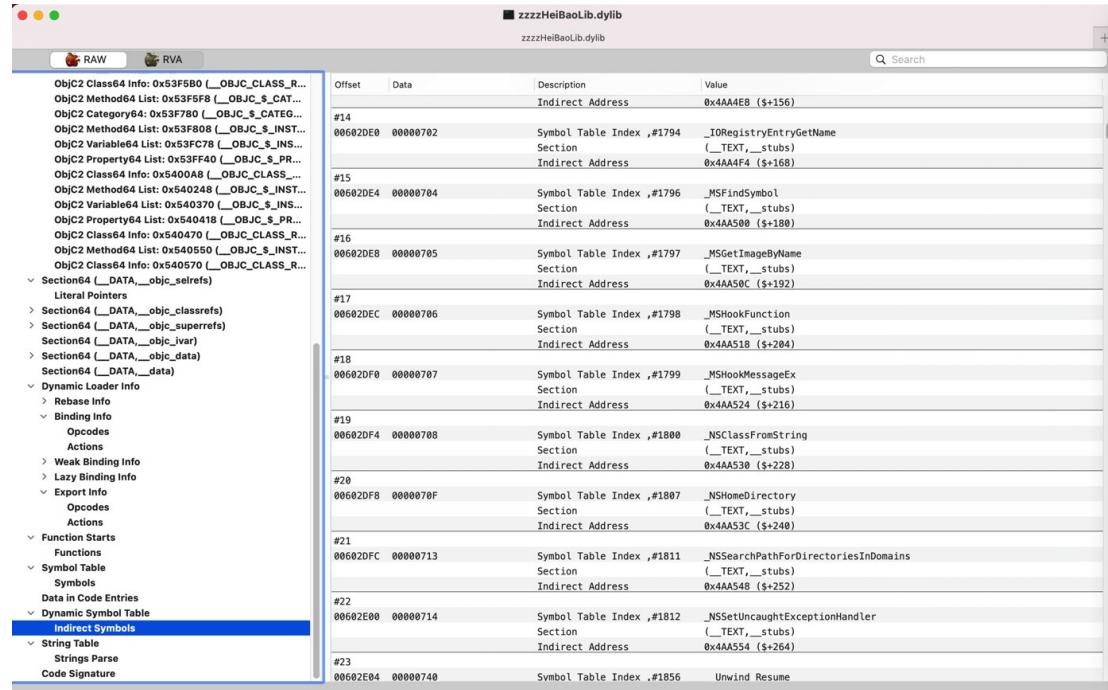

- 正在分析
  - 
  - `__DATA, __mode_init_func`
  - 
  - `__TEXT, __stubs`

- 
- `__TEXT,__objc_methname`
  
- 
- Dynamic Loader Info
  - Export Info
    - Actions

- Dynamic Symbol Table

- Indirect Symbols

2023-10-07 23:22:35

## MachOView使用心得

一些心得：

- 如果二进制太大，或者本身防护做的比较好，则：MachOView完全加载出来二进制信息
  - 往往耗时很久
  - 也往往直接崩溃，无法继续使用
    - 比如抖音的二进制加载到最后，就被崩溃。
    - 只能在崩溃之前，及时查看（大）部分已解析出的信息

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-07 15:38:26

## 自己编译

- 需求：想要自己编译gdbinit的MachOView
- 步骤

下载代码：

```
git clone https://github.com/gdbinit/MachOView.git
```

双击 machoview.xcodeproj 用XCode打开

即可自己编译

## 常见报错

### unable to find sdk 'macosx10.9'

- 解决办法
  - TARGETS -> Build Settings -> Architecture -> Base SDK , 从 macosx 10.9(SDK not found) 改为： macOS

### MachOView/FatLayout.mm:9:10: 'string' file not found

- 解决办法
  - TARGETS -> Build Settings -> Deployment -> macOS Deployment Target ,  
从 macOS10.7 改为和你当前macOS版本一致或最接近的版本
    - 此处系统是 macOS 11.6 , 但此处选项 macOS 11.6 , 所以选了最接近的 macOS 11.5

## rabin2

### 下载和安装

从官网[radare](#), 找到下载地址来源, 比如

[Releases · radareorg/radare2](#)

下载对应的版本, 比如我此处的:

- Mac
  - Intel Chip
    - [radare2-x64-5.7.8.pkg](#)

然后去安装pkg包, 安装后, 即可有 `/usr/local/bin/rabin2`

之前某次安装后的版本:

```
→ ~ rabin2 --version
rabin2: illegal option -- -
rabin2 4.3.1 134 @ darwin-x86-64 git.4.3.1
commit: 815529f204bede6a232fce8b3ac88a905c6943c6 build: 2020-03-06_16:31:10
```

### 资料

- Radare2 官网资料
  - [Introduction - The Official Radare2 Book](#)
  - [Rabin2 - The Official Radare2 Book](#)

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新:

## rabin2用法

- `-I` : File Identification

```
rabin2 -I binaryFile
```

- `-e` : Entrypoint

```
rabin2 -e binaryFile
```

- `-i` : Imports

```
rabin2 -i binaryFile
```

- `-E` : Exports

```
rabin2 -E binaryFile
```

- `-s` : Symbols

```
rabin2 -s binaryFile
```

- `-l` : Libraries

```
rabin2 -l binaryFile
```

- `-z` : Strings

```
rabin2 -z binaryFile
```

- `s` : Program Sections

```
rabin2 -S binaryFile
```

## 心得

很多的参数，都可以加上r，表示（输出内容是一致的，但是格式不同）以radare格式输出

举例：

```
rabin2 -I
```

```
rabin2 -Ir
```

```
rabin2 -s
```

```
rabin2 -sr
```

```
rabin2 -z
```

```
rabin2 -zr
```

```
rabin2 -S  
rabin2 -Sr
```

## rabin2用法举例：AwemeCore

用rabin2查看抖音AwemeCore二进制的信息：

概述：

```
(1) File Identification  
rabin2 -I AwemeCore

(2) Entrypoint  
rabin2 -e AwemeCore

(3) Imports  
rabin2 -i AwemeCore

(4) Exports  
rabin2 -E AwemeCore > AwemeCore_rabin2_E.txt

(5) Symbols  
rabin2 -S AwemeCore > AwemeCore_rabin2_s.txt  
rabin2 -sr AwemeCore > AwemeCore_rabin2_sr.txt

(6) Libraries  
rabin2 -l AwemeCore > AwemeCore_rabin2_l.txt

(7) Strings  
rabin2 -z AwemeCore > AwemeCore_rabin2_z.txt  
rabin2 -zr AwemeCore > AwemeCore_rabin2_zr.txt

(8) Program Sections  
rabin2 -S AwemeCore > AwemeCore_rabin2_S_section.txt  
rabin2 -Sr AwemeCore > AwemeCore_rabin2_Sr_section.txt
```

详解：

### -I : File Identification

```
→ AwemeCore rabin2 -I ../../../../../../已脱壳/v18.9.0/Payload/Aweme.app/Frameworks/AwemeCore.framework/AwemeCore  
arch      arm  
baddr    0x0  
binsz    240666608  
bintype   mach0  
bits     64  
canary   true  
class    MACH064  
crypto   false  
endian   little  
havecode true  
laddr    0x0  
lang     swift
```

```

```

1873260 0x11476910 0x11476910 LOCAL FUNC 0 func.11476910
1873261 0x11476948 0x11476948 LOCAL FUNC 0 func.11476948
1873262 0x11476970 0x11476970 LOCAL FUNC 0 func.11476970

```

The screenshot shows the Xcode debugger interface with three tabs open:

- AwemeCore\_rabin2\_s.txt - exportString**: The assembly dump tab, which displays the assembly code for the specified file.
- AwemeCore\_jtool2\_l\_list.txt**: A list of symbols found in the jtool2 library.
- AwemeCore\_rabin2\_s.txt**: The source code file being analyzed.

The assembly dump shows several entries for symbols starting with `func.`, such as `func.11476910`, `func.11476948`, and `func.11476970`. The assembly code is highly obfuscated, with many local variables and function calls. The source code file (`AwemeCore_rabin2_s.txt`) contains mostly empty functions or placeholder code.

## rabin2的help语法

```

→ ~ rabin2 --help
rabin2: illegal option -- -
Usage: rabin2 [-AcdeEghHijlLMqrRsUVvXzz] [-@ at] [-a arch] [-b bits] [-B addr]
              [-C F:C:D] [-f str] [-m addr] [-n str] [-N m:M] [-P[-P] pdb]
              [-o str] [-O str] [-k query] [-D lang symname] file
-@ [addr]      show section, symbol or import at addr
-A             list sub-binaries and their arch-bits pairs
-a [arch]       set arch (x86, arm, ... or <arch\_bits>)
-b [bits]       set bits (32, 64 ...)
-B [addr]       override base address (pie bins)
-c             list classes
-cc            list classes in header format
-C [fmt:C:D]   create [elf,mach0,pe] with Code and Data hexpairs (see -a)
-d             show debug/dwarf information
-D lang name  demangle symbol name (-D all for bin.demangle=true)
-e             entrypoint
-ee            constructor/destructor entrypoints
-E             globally exportable symbols
-f [str]        select sub-bin named str
-F [binfmt]    force to use that bin plugin (ignore header check)
-g             same as -SMZIHVResizeld -SS -SSS -ee (show all info)
-G [addr]      load address + offset to header
-h             this help message
-H             header fields
-i             imports (symbols imported from libraries)
-I             binary info
-j             output in json
-k [sdb-query] run sdb query. for example: !*
-K [algo]      calculate checksums (md5, sha1, ...)
-l             linked libraries
-L [plugin]   list supported bin plugins or plugin details
-m [addr]      show source line at addr
-M             main (show address of main symbol)
-n [str]        show section, symbol or import named str
-N [min:max]  force min:max number of chars per string (see -z and -zz)
-o [str]        output file/folder for write operations (out by default)
-O [str]        write/extract operations (-O help)
-p             show physical addresses
-P             show debug/pdb information
-PP            download pdb file for binary
-q             be quiet, just show fewer data
-qq            show less info (no offset/size for -z for ex.)
-Q             show load address used by dlopen (non-aslr libs)
-r             radare output
-R             relocations
-s             symbols
-S             sections
-SS            segments
-SSS           sections mapping to segments
-t             display file hashes
-T             display file signature

```

```
-U          unfiltered (no rename duplicated symbols/sections)
-U          resources
-V          display version and quit
-V          Show binary version information
-W          display try/catch blocks
-X          extract bins contained in file
-X [fmt] [f] ... package in fat or zip the given files and bins contained in file
-Z          strings (from data section)
-ZZ         strings (from raw bins [e bin.rawstr=1])
-ZZZ        dump raw strings to stdout (for huge files)
-Z          guess size of binary program

Environment:
RABIN2_LANG:      e bin.lang           # assume lang for demangling
RABIN2_NOPLUGINS: # do not load shared plugins (speedup loading)
RABIN2_DEMANGLE:  0:e bin.demangle     # do not demangle symbols
RABIN2_MAXSTRBUF: e bin.maxstrbuf    # specify maximum buffer size

RABIN2_PREFIX:    e bin.prefix        # prefix symbols/sections/relocs with a specific
string
R2_CONFIG:        # sdb config file
```

## jtool2

- jtool2
  - 旧版叫: otool
  - 类似于 otool 的, 解析查看 Mach-O 文件格式信息
    - 区别: 添加了许多 Mach-O 相关的命令
      - jtool / jtool2 比 otool 功能更完善
  - 支持多种运行平台
    - OS X = Mac
    - iOS
    - Linux
  - 功能
    - in-binary search functionality
    - symbol injection
    - built-in disassembler functionality with (limited but constantly improving) emulation capabilities, which already outdo fancy commercial GUI disassemblers.
    - Color terminal output, enabled by JCOLOR=1
  - 资料
    - 官网
      - JTool2 - Taking the O out of otool - squared
      - <http://www.newosxbook.com/tools/jtool.html>

## 安装jtool2

Mac 中安装 jtool2 :

- Intel的CPU的Mac = Intel Mac
  - 方式1: brew
 

```
brew install --cask jtool2
```
  - 方式2: 官网下载二进制
    - 从[JTool2官网](#)下载jtool2.tgz
    - 解压得到: jtool2 (和 disarm )
      - 提示: 可以把路径加到启动脚本的 PATH 中 (再source) , 使得命令行中可以使用
- (M1/M2等) M系列CPU的Mac = Apple Silicon Mac
 

```
brew tap excitedplus1s/repo/jtool2
brew install --no-quarantine excitedplus1s/repo/jtool2
```

## 常见问题

### killed

- 问题: Mac M2 Max + macOS Ventura 13.2.1 中, 用brew安装的原始版本=[官网版本的jtool2](#), 运行

## 崩溃Killed

```
→ ~ which jtool2
/usr/local/bin/jtool2
→ ~ jtool2 --version
[1] 69975 killed      jtool2 --version
→ ~ jtool2 --help
[1] 70025 killed      jtool2 --help
```

## • 原因：签名问题

## ◦ 找崩溃日志，找到原因了

## • 解决办法：换装另外的版本：

- <https://github.com/excitedplus1s/jtool2>

```
brew tap excitedplus1s/repo/jtool2
brew install --no-quarantine excitedplus1s/repo/jtool2
```

- 即可正常使用jtool2

```
→ jtool2 which jtool2
/usr/local/bin/jtool2
→ jtool2 jtool2 --version
This is 2.1-The Resurgence compiled on Dec 21 2020 21:09:04
```

## jtool2相关资料

- 官网
  - [JTool2 - Taking the O out of otool - squared \(newosxbook.com\)](https://newosxbook.com/jtool2-taking-the-o-out-of-otool-squared.html)

## 常见命令的常见用法举例

官网[JTool2 - Taking the O out of otool - squared \(newosxbook.com\)](https://newosxbook.com/jtool2-taking-the-o-out-of-otool-squared.html)中就有语法介绍：

```
* Otool Compatible options
* dyldinfo Compatible options
* Advanced options:
  * -pages (get layout)
  * -a (lookup address)
  * -S
* Code Singing options
  * --sig
  * --ent
  * --sign
* Objective-C
* Darn Cool Options
```

对应的别人的中文翻译：

## jtool2用法

- `-h` : 查看基本头文件header信息

```
jtool2 -h yourBinary
```

- `-l` : 列出段

```
jtool2 -l yourBinary
```

- `-L` : 查看使用了哪些共享库Library

```
jtool2 -L yourBinary
```

- `-s` : 列出符号表Symbol == nm

```
jtool2 -S yourBinary
```

- `--analyze` : 分析analyze -» 导出类和函数名等

```
jtool2 --analyze yourBinary
```

- `--pages` : 显示layout

```
jtool2 --pages yourBinary
```

## jtool2用法举例

crifan.org, 使用[署名4.0国际\(CC BY 4.0\)协议](#)发布 all right reserved, powered by Gitbook最后更新：  
2023-10-05 16:48:12

## jtool2用法举例：AwemeCore

### -h: 查看header头信息

```
→ AwemeCore jtool2 -h v18.9.0/Payload/Aweme.app/Frameworks/AwemeCore.framework/AwemeCore
Magic: 64-bit MachO (Little Endian)
Type: dylib
CPU: ARM64 (ARMv8)
Cmds: 133
Size: 18720
Flags: 0x910085
```

### -l: list列出段

```
jtool2 -l v18.9.0/Payload/Aweme.app/Frameworks/AwemeCore.framework/AwemeCore
```

输出内容：

```
→ AwemeCore jtool2 -l ../../../../../../已脱壳/v18.9.0/Payload/Aweme.app/Frameworks/AwemeCore.framework/AwemeCore

## jtool2用法举例：MaskPro.dylib

-h

```
→ DynamicLibraries export ARCH=arm64
→ DynamicLibraries jtool2 -h MaskPro.dylib > MaskProDylib/MaskProDylib_jtool2_h_header
.txt
```

输出：

```
Magic: 64-bit MachO (Little Endian)
Type: dylib
CPU: ARM64 (ARMv8)
Cmds: 24
Size: 3304
Flags: 0x100085
```

-l

```
→ DynamicLibraries jtool2 -l MaskPro.dylib > MaskProDylib/MaskProDylib_jtool2_l_list.t
xt
```

输出：

```

0x11c000-0x12ce50 __LINKEDIT (69200 bytes)
0x120d98-0x121f98 Function Starts (4608 bytes)
0x121f98-0x1243e8 Symbol Table (9296 bytes)
0x124d60-0x128f38 String Table (16856 bytes)
0x128f40-0x12ce50 Code Signature (16144 bytes)

```

结果分析：

arm64的akd二进制内部的偏移量：

- 整个 TEXT 代码段是： 0x0-0xf4000 \_\_TEXT (999424 bytes = 976KB)
  - 我们要找到的，单独是程序的二进制代码是： 0x43d0-0xbbf24 \_\_TEXT.\_\_text (752468 bytes) = 约734.8KB

## jtool2的help语法

```

→ ~ jtool2 --help
Usage: jtool [options] _filename_

OTool Compatible Options:
  -h          Dump Mach-O (or DYLD Shared Cache) header
  -l          List sections/commands in binary
  -L          print shared libraries used

JTool (classic) Options:
  -S          List Symbols (like NM)
  -v[v]       Toggle verbosity (vv = very verbose)
  -e          extract fat slice, Mach-O segment/section, dyld shared cache dylib or
(NEW) kernelcache kext
  -q          Quick operation - do not process any symbols in the Mach-O
  -F          find all occurrences of _string_ in binary
  -a          Find offset/segment corresponding to virtual address _addr_
  -o          Find address corresponding to offset _offset_
  -d          Dump (smart dump, will disassemble text and dump data by autodetecting
)

Code Signing Options:
  --sig        Show code signature in binary (if any)
  --stripsig   Remove existing code signature (useful for MacOS unrestricting)
  --ent        Show entitlements in binary (if any)
  -+ent=...[,]... Inject entitlements into binary (implies resigning inplace)
  -+platformize Platformize binary (injects platform-application, also implies resigning inplace)

Joker Compatible Options (applicable on kernel caches only):
  -k          List kexts
  -K          Kextract™ a kernel extension by its bundle ID
  -dec        Decompress a kernelcache to /tmp/kernel (no longer necessary since JT
ool can now operate on compressed caches)

dyldinfo Compatible Options:
  --bind      print addresses dyld will set based on symbolic lookups
  --lazy_bind print addresses dyld will lazily set on first use
  --opcodes   print opcodes used to generate the rebase and binding information
  --function_starts print table of function start addresses

Newer (JTool 2) Options:
  --analyze    Analyze file and create a companion file
  --symbolicate Symbolicate an .ips panic file
  --machoize   [text 0x...-0x...] [strings 0x...-0x...] [data 0x...-0x...] _file
name_
  --tbd        Create a .tbd file (for *OS private frameworks only - you'll need the
dyld shared cache for this)
  --objc       Like old -d objc and/or classdumpZ - Mike, this is for you :-( )
  -D          Decompile (totally experimental - would love your feedback if you're
reading this)
  -G          Gadget search (specify gadgets as comma delimited mnemonics)

```

```
-W           Write [address] [value] - [value] is a string or 0x....
```

**Environment Variables:**

ARCH	Select architecture slice. Set to arm64, arm64e, arm64_32, armv7, armv7k, x86_64 or (not for long) i386
JCOLOR	ANSI Colors. Note you'll need 'less -R' if piping output
JTOOLDIR	path to search for companion jtool files (default: \$PWD).
	Use this to force create a file, if one does not exist
NOPSUP	Suppress NOPs in disassembly
JENTS	Default entitlements (comma separated) for --sign
JHASH	Choice of Hash algorithm for signing (SHA1,SHA256 (default), SHA256T, SHA384)
JSHUDDUP	Suppress stderr (risky, but useful)
JDEBUG	Enhanced debug output. May be very verbose
JDEBUGCS	Debug output specifically for code signing operations. Useful to watch these step-by-step
WITHSIGBLOB	Code signing: Also create an empty CMS blob (no longer a default due to CoreTrust)

## otool

- otool
  - = object file displaying tool
  - 是什么：查看目标文件信息的工具
  - 用途：用来发现应用中使用到了哪些系统库，调用了其中哪些方法，使用了库中哪些对象及属性
    - 比如
      - 查看iOS的 Mach-o 格式的二进制文件的信息
  - 来源：Xcode自带的常用工具
- 相关
  - 比otool更好的： jtool
  - otool 的 GUI 版： otx
    - x43x61x69/otx: The Mach-O disassembler. Now 64bit and Xcode 6 compatible.
    - <https://github.com/x43x61x69/otx>

## 下载安装otool

Mac自带otool，无需额外安装。

查看当前otool位置：

```
x crifan@licrifandeMacBook-Pro ~ $ which otool
/usr/bin/otool
```

当前版本：

```
x crifan@licrifandeMacBook-Pro ~ $ otool --version
llvm-otool(1): Apple Inc. version cctools-927.0.2
Apple LLVM version 10.0.1 (clang-1001.0.46.4)
Optimized build.
Default target: x86_64-apple-darwin19.2.0
Host CPU: broadwell

Registered Targets:
aarch64    - AArch64 (little endian)
aarch64_be - AArch64 (big endian)
arm        - ARM
arm64      - ARM64 (little endian)
armeb      - ARM (big endian)
thumb      - Thumb
thumbbeb   - Thumb (big endian)
x86        - 32-bit X86: Pentium-Pro and above
x86-64     - 64-bit X86: EM64T and AMD64
```

## otool用法

- 单个参数

- l : print the load commands

```
otool -l iOSBinaryFile
```

- L : print shared Libraries used

```
otool -L iOSBinaryFile
```

- o : print the Objective-C segment

- v : print disassembled operands symbolically

- 参数组合

- ov

```
otool -ov iOSBinaryFile
```

- tv

```
otool -tv iOSBinaryFile
```

- 用途

- 用otool去手动计算地址转函数

```
otool -arch <arch> -l <path_to_dsym> | grep __TEXT -m 2 -A 1 | grep vmaddr
```

## 常见问题

### is not an object file

otool只支持查看Mach-O格式的文件，不支持其他格式的文件。

比如如果用otool查看ELF格式的话，会报错：

```
→ arm64-v8a otool -L libtacker.so
libtacker.so: is not an object file

→ arm64-v8a otool -ov libtacker.so
libtacker.so: is not an object file
```

## otool用法举例

## 查看是否加密=脱壳

- 未加密

```

→ Aweme.app otool -l Aweme | grep crypt
cryptoff 28672
cryptsize 4096
cryptid 0

```

- 说明

- cryptid 0 : 表示未加密 = 已脱壳

- 已加密

```

→ Aweme.app pwd
xxx/Aweme抖音/1Phone7-137black/Aweme.app
→ Aweme.app otool -l Aweme | grep crypt
cryptoff 28672
cryptsize 4096
cryptid 1

```

- 说明

- cryptid 1 : 表示已加密 = 未脱壳

- L

```

→ Aweme.app otool -L Aweme
Aweme:
    @rpath/AwemeCore.framework/AwemeCore (compatibility version 1.0.0, current version

```

```
1.0.0)
/System/Library/Frameworks/Foundation.framework/Foundation (compatibility version 3
00.0.0, current version 1854.0.0)
/usr/lib/libobjc.A.dylib (compatibility version 1.0.0, current version 228.0.0)
/usr/lib/libSystem.B.dylib (compatibility version 1.0.0, current version 1311.0.0)
@rpath/libswiftCore.dylib (compatibility version 1.0.0, current version 1300.0.29)
```

## otool用法举例：AwemeCore

- 输入文件：

```
/Users/crifan/dev/DevRoot/iOSReverse/Aweme/exportFromiPhone/iPhone7P-1341/Aweme.app
/Frameworks/AwemeCore.framework

→ AwemeCore.framework 11
total 10208480
-rw-r--r-- 1 crifan staff 230M 1 8 09:43 AwemeCore
```

-l

```
→ AwemeCore.framework otool -l AwemeCore > otool_l_AwemeCore.txt
```

输出内容（很多，有2000多行）：

```
AwemeCore:

## 输出内容分析

其中也有AWECloudJailBreakUtility:

```

00000000000322a18 0x9bf000
isa      0x9befd8
superclass 0x0 _OBJC_CLASS_$_NSObject
cache     0x0 __objc_empty_cache
vtable   0x0
data     0x3921f8
flags     0x80
instanceStart 8
instanceSize 8
reserved   0x0
ivarLayout 0x0
name      0xe12aaaf AWECloudJailBreakUtility
baseMethods 0x0
baseProtocols 0x0
ivars     0x0
weakIvarLayout 0x0
baseProperties 0x0
Meta Class
isa      0x0 _OBJC_METACLASS_$_NSObject
superclass 0x0 _OBJC_METACLASS_$_NSObject
cache     0x0 __objc_empty_cache
vtable   0x0
data     0x3921b0
flags     0x81 RO_META
instanceStart 40
instanceSize 40
reserved   0x0
ivarLayout 0x0
name      0xe12aaaf AWECloudJailBreakUtility
baseMethods 0x0
baseProtocols 0x0
ivars     0x0
weakIvarLayout 0x0
baseProperties 0x0

```

且信息更全：

- 父类=superclass是：`_OBJC_METACLASS_$_NSObject`

对于：

- name `0xe12aaaf AWCloudJailBreakUtility`
  - >好像是：`AWCloudJailBreakUtility` 这个类的位置是 `0xe12aaaf`

-》如果是：则就是我们之前，曾想要的：

通过类名字：`AWCloudJailBreakUtility`

去寻找其具体地址：`0xe12aaaf`

->用于去后续（lldb、XCode等）调试中，去打断点

另外搜：`jail`

也是能搜到，类似于strings找到的几个：

```
... nm_AwemeCore.txt ... strings_AwemeCore_removeNoUse.txt ... otool_l_AwemeCore.txt ... otool_oV_AwemeCore.txt ...
Aweme.app > Frameworks > AwemeCore.framework > otool_oV_AwemeCore.txt
jail

-》

- name 0xd99adb btd\_isJailBroken
  - name 0xe1ce54 BTDAdditions
  - cls 0x0 \_OBJC\_CLASS\_\$\_UIDevice

-》 前面2个：

- BDXAdditions
- BTDAdditions

都是属于：

- cls 0x0 \_OBJC\_CLASS\_\$\_UIDevice

-》 估计都是：

- 集成自 = 父类是: UIDevice

另外:

- BTDAdditions
  - btd\_carrierName
  - btd\_carrierMCC
  - btd\_carrierMNC
  - btd\_poorDevice

等, 好像和:

- 检测当前设备信息
- 改机参数

有关 -》 也算是, 和检测越狱有关?

**-tv**

```
→ AwemeCore.framework otool -tv AwemeCore > otool_tv_AwemeCore.txt
```

输出:

```
AwemeCore:  
(__TEXT,__text) section
```

## otool用法举例：MaskPro.dylib

-1

```
→ DynamicLibraries otool -l MaskPro.dylib > MaskProDylib/MaskProDylib_otool_l.txt
```

输出：

```

## otool的help语法

```
x crifan@licrifandeMacBook-Pro ~ $ otool -help
error: /Applications/Xcode.app/Contents/Developer/Toolchains/XcodeDefault.xctoolchain/usr/bin/otool: unknown char `p' in flag -help

Usage: /Applications/Xcode.app/Contents/Developer/Toolchains/XcodeDefault.xctoolchain/usr/bin/otool [-arch arch_type] [-fahlLDtdorSTMRIHGvVcXmqQjCP] [-mcpu=arg] [--version] <object file> ...
-f print the fat headers
-a print the archive header
-h print the mach header
-l print the load commands
-L print shared libraries used
-D print shared library id name
-t print the text section (disassemble with -v)
-p <routine name> start disassemble from routine name
-s <segname> <sectname> print contents of section
-d print the data section
-o print the Objective-C segment
-r print the relocation entries
-S print the table of contents of a library (obsolete)
-T print the table of contents of a dynamic shared library (obsolete)
-M print the module table of a dynamic shared library (obsolete)
-R print the reference table of a dynamic shared library (obsolete)
-I print the indirect symbol table
-H print the two-level hints table (obsolete)
-G print the data in code table
-v print verbosely (symbolically) when possible
-V print disassembled operands symbolically
-c print argument strings of a core file
-X print no leading addresses or headers
-m don't use archive(member) syntax
-B force Thumb disassembly (ARM objects only)
-q use llvm's disassembler (the default)
-Q use otool(1)'s disassembler
-mcpu=arg use `arg' as the cpu for disassembly
-j print opcode bytes
-P print the info plist section as strings
-C print linker optimization hints
--version print the version of /Applications/Xcode.app/Contents/Developer/Toolchains/XcodeDefault.xctoolchain/usr/bin/otool
```

## pagestuff

- pagestuff
  - 是什么: Mach-O格式文件分析工具
  - 作用: 显示Mach-O的每个逻辑页的信息, 比如section名称、符号表等
  - 注: 不支持 FAT 格式的Mach-O

## 安装

- 无需安装
  - Mac中自带
    - 路径: /usr/bin/pagestuff

## 使用

- 举例

◦

2023-10-07 22:04:48

## pagestuff的help语法

```
→ ~ pagestuff
Usage: /Applications/Xcode.app/Contents/Developer/Toolchains/XcodeDefault.xctoolchain/usr/bin/pagestuff mach-o [-arch name] [-p] [-a] pagenumber [pagenumber ...]
```

## man手册
